1 Introduction

We usually define Floer homology for Lagrangian submanifolds in symplectic manifolds, but there are many important *non-smooth* guys such as algebraic varieties and Lagrangian subvarieties. Our first plan to construct Floer theory for such non-smooth objects is to do for something like open strata of them. The open strata are non-compact, and we will start with *concave* ends.

Floer's chain complexes for Lagrangian submanifolds in closed symplectic manifolds are generated by intersection points of Lagrangian submanifolds and whose differentials count pseudo-holomorphic strips with Lagrangian boundary conditions. In this paper we will propose Floer's chain complexes for Lagrangian submanifolds in symplectic manifolds with *concave ends*.

A *symplectic form* ω on a smooth manifold X is a non-degenerate closed 2-form. The non-degeneracy induces the existence of almost complex structures J such that $\omega(\cdot, J\cdot)$ is a metric on X. In particular, we consider time-dependent almost complex structures $J_t, t \in [0,1]$.

A *Lagrangian submanifold* L is an n-dimensional submanifold in X^{2n} such that $\omega|_{TL} = 0$. Here we assume the following conditions for Lagrangian submanifolds L_0 and L_1.

Assumption 1.1 *(Nondegeneracy of intersections)L_0 and L_1 intersect transversally.*

Assumption 1.2 *(Admissibility)If $u : S^1 \times [0,1] \to X$ is a map such that $u(S^1, 0) \subset L_0$ and $u(S^1, 1) \subset L_1$, then $\int_{S^1 \times [0,1]} u^*\omega = 0$.*

Let (X, J) be an almost complex manifold and (Σ, j) a Riemann surface with a complex structure j. A pseudo-holomorphic curve is a map $u : \Sigma \to X$ such that

$$\overline{\partial}_J u := \frac{1}{2}(du + J \circ du \circ j) = 0.$$

Our Riemann surface is $\mathbf{R} \times [0,1]$ with the natural complex structure i, and our almost complex structures on X are time-dependent, then we consider the following elliptic partial differential equation

$$\overline{\partial}_{J_t} u(\tau, t) := \frac{\partial u(\tau, t)}{\partial \tau} + J_t(u(\tau, t)) \frac{\partial u(\tau, t)}{\partial t} = 0,$$

where $(\tau, t) \in \mathbf{R} \times [0,1]$. Define $\mathcal{M}(p, q)$, for p and $q \in L_0 \cap L_1$, to be the set of maps $u : \mathbf{R} \times [0,1] \to X$ such that

- $u(\mathbf{R}, 0) \subset L_0$ and $u(\mathbf{R}, 1) \subset L_1$
- $\lim_{\tau \to -\infty} u(\tau, [0,1]) = p$ and $\lim_{\tau \to \infty} u(\tau, [0,1]) = q$
- $\overline{\partial}_{J_t} u(\tau, t) = 0$.

We call a map satisfying the above conditions a *pseudo-holomorphic strip* and $\mathcal{M}(p, q)$ the *moduli space of pseudo-holomorphic strips.* Note that $\mathbf{R}$ acts on $\mathcal{M}(p, q)$ by $(a * u)(\tau, t) := u(\tau - a, t)$ with $a \in \mathbf{R}$. We denote the quotient by $\hat{\mathcal{M}}(p, q)$. Then Floer proved the following theorem [5].

Theorem 1.3 *If J_t is generic, then $\mathcal{M}(p, q)$ is a smooth finite dimensional manifold.*

The generic means that J_t is an element of a Baire category set in a certain Banach space of time-dependent almost complex structures.

For the compactification of the moduli spaces in Floer's context, we need the following condition.

Assumption 1.4 *(π_2-condition)If $u : D^2 \to X$ is a map such that $u(\partial D^2) \subset L$, then $\int_{D^2} u^*\omega = 0$.*

Assume that L_0 and L_1 satisfy the π_2-condition.

Theorem 1.5 *Let X be a closed symplectic manifold. Then $\hat{\mathcal{M}}(p,q)$ can be compactified (with respect to the topology of uniform convergence with all derivatives on compact set).*

In fact, if the dimension of $\hat{\mathcal{M}}(p,q)$ is equal to 0, then $\hat{\mathcal{M}}(p,q)$ is compact, and if the dimension of $\hat{\mathcal{M}}(p,q)$ is equal to 1, then it can be compactified so that the boundary is

$$\bigcup_{\dim \hat{\mathcal{M}}(p,r) = \dim \hat{\mathcal{M}}(r,q) = 0} \hat{\mathcal{M}}(p,r) \times \hat{\mathcal{M}}(r,q). \tag{1}$$

(To show (1) we need also the gluing theorem [5].)

Let C be the free $\mathbf{Z}_2$-vector space over the elements of $L_0 \cap L_1$. We define a linear map $\partial : C \to C$ in terms of the canonical bases

$$\partial p := \sum_{q \in L_0 \cap L_1} \sharp \hat{\mathcal{M}}(p,q) q,$$

where the sum ranges over all $q \in L_0 \cap L_1$ such that $\dim \hat{\mathcal{M}}(p,q) = 0$ and where $\sharp \hat{\mathcal{M}}(p,q)$ is the modulo 2 number of the elements of $\hat{\mathcal{M}}(p,q)$. Then Floer proved the following theorem [5].

Theorem 1.6 *$\partial \circ \partial = 0$.*

The idea of Theorem 1.6 is very important for us, hence we adopt the proof. For $p \in L_0 \cap L_1$

$$\begin{aligned} \partial\partial p &= \partial \sum_{q \in L_0 \cap L_1} \sharp \hat{\mathcal{M}}(p,q) q \\ &= \sum_{r \in L_0 \cap L_1} \sum_{q \in L_0 \cap L_1} \sharp \hat{\mathcal{M}}(p,q) \sharp \hat{\mathcal{M}}(q,r) r. \end{aligned}$$

$\sum_{q\in L_0\cap L_1}\sharp\hat{\mathcal{M}}(p,q)\sharp\hat{\mathcal{M}}(q,r)$ is nothing but the number of the boundary components of the compactification of a 1-dimensional smooth manifold $\hat{\mathcal{M}}(p,r)$, and then even.

We call the chain complex (C,∂) the *Floer's chain complex* for L_0 and L_1 in X.

By using the universal Novikov ring as in [9], we can remove the admissibility. On the other hand, many persons made effort to weaken the π_2-condition [15] and [16], and it grows into an obstruction theory of the boundary operators [9].

Next we will consider (1) from another angle. Let $\{u_i\}_{i=1,2,\ldots}$ be a sequence of elements in $\hat{\mathcal{M}}(p,q)$ which converges to an element $(v,w)\in\hat{\mathcal{M}}(p,r)\times\hat{\mathcal{M}}(r,q)$, see Figure 1.

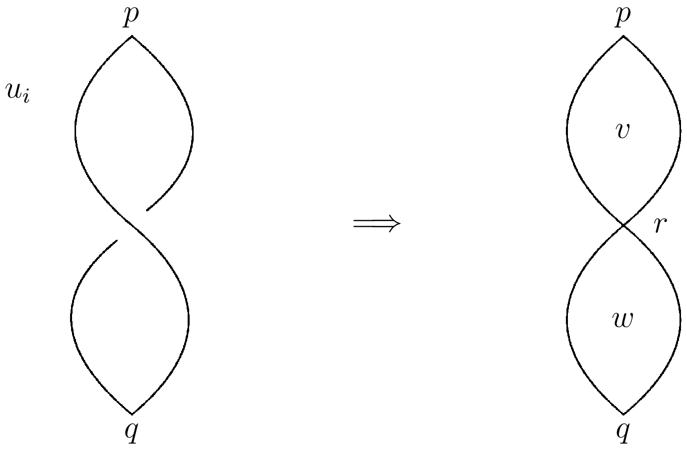

Figure 1

This phenomenon implies that, *at the limit of the sequence, a generator r of the Floer's chain complex appears at the intersection point r.* For simplicity, we assume that X, around r, is locally isomorphic to $\mathbf{C}^n$, where r corresponds to the origin, and L_0 and L_1 are locally isomorphic to $\mathbf{R}^n$ and $(\sqrt{-1}\mathbf{R})^n$, respectively. Consider $\mathbf{C}^n\setminus\{0\}$ to be $(0,\infty)\times S^{2n-1}$ through the polar coordinate, and moreover transform it into $\mathbf{R}\times S^{2n-1}$

by

$$(0,\infty)\times S^{2n-1}\to \mathbf{R}\times S^{2n-1},\ (\rho,x)\mapsto(\alpha,x):=(\log\rho,x),$$

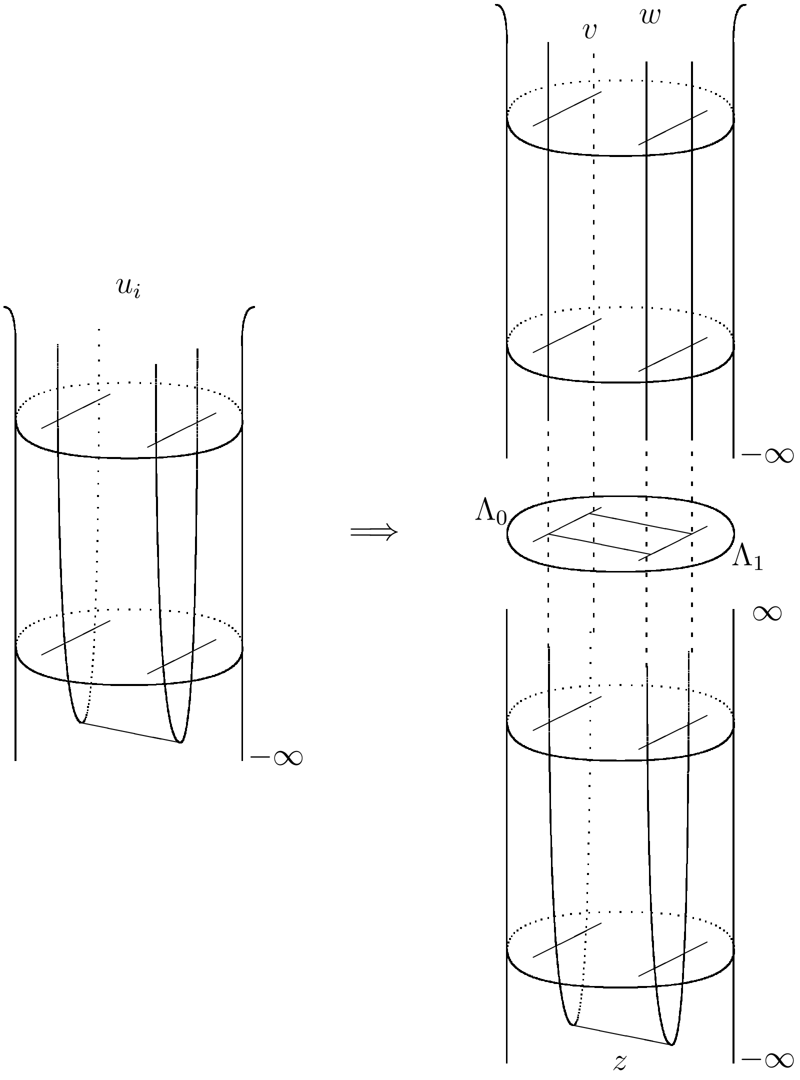

Figure 2

so that L_0 and L_1 are locally diffeomorphic to $\mathbf{R}\times\Lambda_0$ and $\mathbf{R}\times\Lambda_1$, respectively, where Λ_0 and Λ_1 are (Legendrian) submanifolds in S^{2n-1}

(with the standard contact form). Then the limit of $\{u_i\}_{i=1,2,\dots}$ looks like the following: u_i's grow toward $-\infty$, and at the limit there appear three pseudo-holomorphic strips v, w and z as in Figure 2. (The segments between Λ_0 and Λ_1 are Reeb chords.)

In comparison with the intersection point r, this phenomenon implies that, *at the limit of the sequence, a generator z of the Floer's chain complex for $L_0 \setminus \{r\}$ and $L_1 \setminus \{r\}$ in $X \setminus \{r\}$ appears at $-\infty$ of the (concave) end.*

The content of our paper is as follows: Section 2 defines concave/convex ends of non-compact symplectic manifolds and pseudo-holomorphic strips. Section 3 proposes Floer's chain complexes for Lagrangian submanifolds in symplectic manifolds with concave/convex ends. Section 4 proves some gluing arguments for pseudo-holomorphic strips and Section 5 observes the bubbling off phenomenon for pseudo-holomorphic curves.

Sign convention; through this paper, L_1^p is the space of functions/sections f such that $\int |f|^p + \int |Df|^p < \infty$ *for* $p > 2$.

2 Pseudo-holomorphic strips in symplectic manifolds with concave ends

Let M be a smooth oriented manifold of dimension $2n+1$. A *contact form* on M is a 1-form λ such that $\lambda \wedge (d\lambda)^n$ is a volume form on M. Then the 2-form $d(e^\alpha \lambda)$ is a symplectic structure in $\mathbf{R} \times M$, where $\alpha \in \mathbf{R}$. We call $(\mathbf{R} \times M, d(e^\alpha\lambda))$ the *symplectization* of (M, λ), and there is a natural projection $\pi_M : \mathbf{R} \times M \to M$.

Let X be a non-compact symplectic manifold which, out side a compact set, is diffeomorphic to cylinders. If a cylinder is symplectically isomorphic to $((-\infty, R_-) \times M_-, d(e^\alpha \lambda_-))$ for (M_-, λ_-) and $R_- \in \mathbf{R}$, then we call the cylinder a *concave end.* Similarly, if a cylinder is symplectically isomorphic to $((R_+, \infty) \times M_+, d(e^\alpha \lambda_+))$ for (M_+, λ_+) and $R_+ \in \mathbf{R}$, then we call the cylinder a *convex end.*

A *Legendrian submanifold* Λ is an n-dimensional submanifold in (M^{2n+1}, λ)

which satisfies $T\Lambda \subset \mathrm{Ker}\lambda$. Then $\mathbf{R} \times \Lambda$ is a Lagrangian submanifold in the symplectization.

Let L be a Lagrangian submanifold in a non-compact symplectic manifold whose ends are concave or convex. If L is non-compact, then we assume that L satisfies the following.

Assumption 2.1 *(Cone-condition)*$L|_{(-\infty,R_-)\times M_-} = (-\infty, R_-)\times\Lambda_-$ *and* $L|_{(R_+,\infty)\times M_+} = (R_+,\infty)\times\Lambda_+$, *where* Λ_- *and* Λ_+ *are Legendrian submanifolds.*

Associated to λ there are two important structures. First of all the so-called Reeb vector field $X = X_\lambda$ defined by $i_X\lambda \equiv 1$ and $i_X d\lambda \equiv 0$, and secondly the contact structure $\xi = \xi_\lambda$ given by $\xi := \mathrm{Ker}\lambda \subset TM$. TM splits into $\mathbf{R}X_\lambda \oplus \xi$, and we have a natural projection $\pi_\xi : TM \to \xi$. (We shall use the same notation ξ to denote $\pi_M^*\xi$.) Moreover, on the symplectization, $T(\mathbf{R}\times M)$ splits into $E\oplus\xi$, where $E := \mathbf{R}\frac{\partial}{\partial\theta} \oplus \pi_M^*\mathbf{R}X_\lambda$, and we will use a natural projection $\pi_E : T(\mathbf{R}\times M) \to E$.

Let $\{\varphi_t\}_{0\le t\le T}$ be the isotopy on M such that

$$\begin{cases} \frac{d}{dt}\varphi_t &= X_\lambda \circ \varphi_t, \\ \varphi_0 &= \mathrm{id}. \end{cases}$$

From the definition, we can conclude that $\frac{d}{dt}(\varphi_t^*\lambda) = 0$ and $\frac{d}{dt}(\varphi_t^* d\lambda) = 0$, and then $d\varphi_T(\xi_p) = \xi_{\varphi_T(p)}$ and $d\varphi_T X_\lambda(p) = X_\lambda(\varphi_T(p))$ for $p \in M$.

We call a map $\gamma : \mathbf{R}/T\mathbf{Z} \to M$ such that $\dot\gamma = X_\lambda(\gamma)$ a *closed characteristic* of period T. Similarly, we call a map $\gamma : [0,T] \to M$ such that $\dot\gamma = X_\lambda(\gamma)$ with $\gamma(0) \in \Lambda_0$ and $\gamma(T) \in \Lambda_1$, where Λ_0 and Λ_1 are Legendrian submanifolds, a *Reeb chord* from Λ_0 to Λ_1 of length T.

The restriction of $d\lambda$ on ξ is non-degenerate, hence $d\lambda|_\xi$ induces complex structures I on ξ such that the bilinear form

$$d\lambda(x)(h, I(x)k),\ h,k \in \xi_x$$

is a positive definite inner product, and then

$$g_M(h,k) := \lambda(h)\lambda(k) + d\lambda(\pi_\xi(h), I\pi_\xi(k)),\ h,k \in TM,$$

gives a metric on M. For $a, b \in \mathbf{R}$ and $k \in \xi$,

$$\overline{I}(a\frac{\partial}{\partial\theta} + bX_\lambda + k) := -b\frac{\partial}{\partial\theta} + aX_\lambda + Ik$$

is an almost complex structure on $\mathbf{R} \times M$, and the equation of pseudo-holomorphic curve for $\overline{u} := (\alpha, u) : \Sigma \to \mathbf{R} \times M$ turns out to be

$$\begin{cases} \pi_\xi \circ du + I\pi_\xi \circ du \circ j &= 0, \\ (u^*\lambda) \circ j &= d\alpha. \end{cases}$$

For pseudo-holomorphic strips we consider time-dependent complex structures I_t on ξ, and if X is a symplectic manifolds with concave or convex ends, then we suppose that time-dependent almost complex structures J_t on X, out side a compact set, are of the form $\overline{I_t}$.

Let L_0 and L_1 be Lagrangian submanifolds in X such that $L_0|_{(-\infty,R_-]\times M_-} = (-\infty, R_-]\times\Lambda_0^-$ and $L_0|_{[R_+,\infty)\times M_+} = [R_+,\infty)\times\Lambda_0^+$, and also $L_1|_{(-\infty,R_-]\times M_-} = (-\infty, R_-] \times \Lambda_1^-$ and $L_1|_{[R_+,\infty)\times M_+} = [R_+,\infty) \times \Lambda_1^+$. We assume that L_0 and L_1 satisfy Assumption 1.1 (, and hence $\Lambda_0^- \cap \Lambda_1^- = \emptyset$ and $\Lambda_0^+ \cap \Lambda_1^+ = \emptyset$). Moreover we assume the following condition for Λ_0^- and Λ_1^-.

Assumption 2.2 *(Nondegeneracy of Reeb chords) Let $\gamma : [0,T] \to M$ be a Reeb chord from Λ_i^- to Λ_j^-, $i \neq j$. Then $d\varphi_T(T_{\gamma(0)}\Lambda_i^-)$ and $T_{\gamma(T)}\Lambda_j^-$ intersect transversally in $\xi_{\gamma(T)}$, where $\{\varphi_t\}_{0\le t\le T}$ is the isotopy generated by the Reeb vector field.*

From the above assumption we can conclude that Reeb chords are isolated.

Now we will consider non-constant pseudo-holomorphic strips, i.e., maps $\overline{u} : \Sigma = \mathbf{R} \times [0,1] \to X$ such that

$$\overline{\partial}_{J_t}\overline{u}(\tau, t) = 0$$
$$\overline{u}(\mathbf{R}, 0) \subset L_0 \text{ and } \overline{u}(\mathbf{R}, 1) \subset L_1,$$

with the following asymptotic conditions. (We are interested in concave ends, hence for simplicity we shall use notation M instead of M_-.) In the following we denote $\overline{u}$ on concave ends $(-\infty, R_-] \times M$ by (α, u):

(I) $\lim_{\tau\to-\infty} \overline{u}(\tau, [0,1]) = p_-$ and $\lim_{\tau\to\infty} \overline{u}(\tau, [0,1]) = p_+$ for p_- and $p_+ \in L_0 \cap L_1$.

(II) $\lim_{\tau\to\infty} \overline{u}(\tau, [0,1]) = p_+ \in L_0 \cap L_1$, and there is a Reeb chord

$\gamma_- : [0,T_-] \to M$ from Λ_0^- to Λ_1^- such that $\lim_{\tau\to-\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to-\infty}u(\tau,t) = \gamma_-(T_-t)$.

(**II′**) $\lim_{\tau\to-\infty}\overline{u}(\tau,[0,1]) = p_- \in L_0 \cap L_1$, and there is a Reeb chord $\gamma_+ : [0,T_+] \to M$ from Λ_1^- to Λ_0^- such that $\lim_{\tau\to\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to\infty}u(\tau,t) = \gamma_+(T_+(1-t))$.

(**III**) There is a Reeb chord $\gamma_- : [0,T_-] \to M$ from Λ_0^- to Λ_1^- such that $\lim_{\tau\to-\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to-\infty}u(\tau,t) = \gamma_-(T_-t)$, and a Reeb chord $\gamma_+ : [0,T_+] \to M$ from Λ_1^- to Λ_0^- such that $\lim_{\tau\to\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to\infty}u(\tau,t) = \gamma_+(T_+(1-t))$.

Moreover we will consider the following extra pseudo-holomorphic strips in the symplectization of M, i.e., $\overline{u} := (\alpha,u) : \Sigma = \mathbf{R}\times[0,1] \to \mathbf{R}\times M$ such that

$$\overline{\partial}_{\overline{I_t}}\overline{u}(\tau,t) = 0$$
$$\overline{u}(\mathbf{R},0) \subset \mathbf{R}\times\Lambda_0^- \text{ and } \overline{u}(\mathbf{R},1) \subset \mathbf{R}\times\Lambda_1^-$$

with the asymptotic conditions:

(**IV**) There is a Reeb chord $\gamma_- : [0,T_-] \to M$ from Λ_1^- to Λ_0^- such that $\lim_{\tau\to-\infty}\alpha(\tau,t) = \infty$ and $\lim_{\tau\to-\infty}u(\tau,t) = \gamma_-(T_-(1-t))$, and a Reeb chord $\gamma_+ : [0,T_+] \to M$ from Λ_0^- to Λ_1^- such that $\lim_{\tau\to\infty}\alpha(\tau,t) = \infty$ and $\lim_{\tau\to\infty}u(\tau,t) = \gamma_+(T_+t)$.

(**V**) There is a Reeb chord $\gamma_- : [0,T_-] \to M$ from Λ_0^- to Λ_1^- such that $\lim_{\tau\to-\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to-\infty}u(\tau,t) = \gamma_-(T_-t)$, and a Reeb chord $\gamma_+ : [0,T_+] \to M$ from Λ_0^- to Λ_1^- such that $\lim_{\tau\to\infty}\alpha(\tau,t) = \infty$ and $\lim_{\tau\to\infty}u(\tau,t) = \gamma_+(T_+t)$.

(**V′**) There is a Reeb chord $\gamma_- : [0,T_-] \to M$ from Λ_1^- to Λ_0^- such that $\lim_{\tau\to-\infty}\alpha(\tau,t) = \infty$ and $\lim_{\tau\to-\infty}u(\tau,t) = \gamma_-(T_-(1-t))$, and a Reeb chord $\gamma_+ : [0,T_+] \to M$ from Λ_1^- to Λ_0^- such that $\lim_{\tau\to\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to\infty}u(\tau,t) = \gamma_+(T_+(1-t))$.

If $\gamma_- = \gamma_+ = \gamma$ of length T, then there is a trivial pseudo-holomorphic strip $\overline{u} := (T\tau, \gamma(Tt))$ of the type (**V**), and also $\overline{u} := (-T\tau, \gamma(T(1-t)))$

of the type $(\mathbf{V}')$.

For the each asymptotic, we put the following exponential decay condition:

$(\mathbf{1})$ If $\lim_{\tau\to-\infty}\overline{u}(\tau,t) = p_- \in L_0 \cap L_1$, then there are some constants ρ_-, C_β^- and $d_- > 0$, and a function $\xi_-(\tau,t) \in C^\infty(\mathbf{R}\times[0,1], T_{p_-}X)$ such that

- $\overline{u}(\tau,t) = \exp_{p_-}\xi_-(\tau,t)$ for $\tau < \rho_-$,
- $|\partial^\beta \xi_-(\tau,t)| < C_\beta^- e^{d_-\tau}$.

$(\mathbf{1}')$ If $\lim_{\tau\to\infty}\overline{u}(\tau,t) = p_+ \in L_0 \cap L_1$, then there are some constants ρ_+, C_β^+ and $d_+ > 0$, and a function $\xi_+(\tau,t) \in C^\infty(\mathbf{R}\times[0,1], T_{p_+}X)$ such that

- $\overline{u}(\tau,t) = \exp_{p_+}\xi(\tau,t)$ for $\rho_+ < \tau$,
- $|\partial^\beta \xi_+(\tau,t)| < C_\beta^+ e^{-d_+\tau}$.

Let $\iota : [0,1]\times\{z \in \mathbf{R}^{2n}, |z| < \varepsilon\} \to M$ be an immersion such that $\iota(t,0) = \gamma(Tt)$, where γ is a Reeb chord of length T:

$(\mathbf{2})$ If $\lim_{\tau\to-\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to-\infty}u(\tau,t) = \gamma_-(T_-t)$, then there are some τ_- such that $u(\tau,t) \in \mathrm{Im}\ \iota_-$ for $\tau < \tau_-$, where ι_- is the immersion with respect to γ_-. If we denote the ι_- pull-back of (α,u) by

$$(\alpha,\theta_-,z_-) : (-\infty,\tau_-]\times[0,1] \to \mathbf{R}\times[0,1]\times\{z\in\mathbf{R}^{2n}, |z|<\varepsilon\},$$

then there are some constants c_-, C_β^- and $d_- > 0$ such that

$$\begin{aligned} |\partial^\beta[\alpha(\tau,t) - (T_-\tau + c_-)]| &\leq C_\beta^- e^{d_-\tau}, \\ |\partial^\beta[\theta_-(\tau,t) - t]| &\leq C_\beta^- e^{d_-\tau}, \\ |\partial^\beta z_-(\tau,t)| &\leq C_\beta^- e^{d_-\tau}. \end{aligned}$$

$(\mathbf{2}')$ If $\lim_{\tau\to\infty}\alpha(\tau,t) = -\infty$ and $\lim_{\tau\to\infty}u(\tau,t) = \gamma_+(T_+(1-t))$, then there are some τ_+ such that $u(\tau,t) \in \mathrm{Im}\ \iota_+$ for $\tau_+ < \tau$, where ι_+ is the immersion with respect to γ_+. If we denote the ι_+ pull-back of (α,u) by

$$(\alpha,\theta_+,z_+) : [\tau_+,\infty)\times[0,1] \to \mathbf{R}\times[0,1]\times\{z\in\mathbf{R}^{2n}, |z|<\varepsilon\},$$

then there are some constants c_+, C^+_β and $d_+ > 0$ such that

$$\begin{aligned}|\partial^\beta[\alpha(\tau,t)-(-T_+\tau+c_+)]| &\leq C^+_\beta e^{-d_+\tau},\\ |\partial^\beta[\theta_+(\tau,t)-(1-t)]| &\leq C^+_\beta e^{-d_+\tau},\\ |\partial^\beta z_+(\tau,t)| &\leq C^+_\beta e^{-d_+\tau}.\end{aligned}$$

(**3**) If $\lim_{\tau\to-\infty}\alpha(\tau,t)=\infty$ and $\lim_{\tau\to-\infty}u(\tau,t)=\gamma_-(T_-(1-t))$, then there are some τ_- such that $u(\tau,t)\in \mathrm{Im}\ \iota_-$ for $\tau<\tau_-$, where ι_- is the immersion with respect to γ_-. If we denote the ι_- pull-back of (α,u) by

$$(\alpha,\theta_-,z_-):(-\infty,\tau_-]\times[0,1]\to\mathbf{R}\times[0,1]\times\{z\in\mathbf{R}^{2n},|z|<\varepsilon\},$$

then there are some constants c_-, C^-_β and $d_- > 0$ such that

$$\begin{aligned}|\partial^\beta[\alpha(\tau,t)-(-T_-\tau+c_-)]| &\leq C^-_\beta e^{d_-\tau},\\ |\partial^\beta[\theta_-(\tau,t)-(1-t)]| &\leq C^-_\beta e^{d_-\tau},\\ |\partial^\beta z_-(\tau,t)| &\leq C^-_\beta e^{d_-\tau}.\end{aligned}$$

(**3′**) If $\lim_{\tau\to\infty}\alpha(\tau,t)=\infty$ and $\lim_{\tau\to\infty}u(\tau,t)=\gamma_+(T_+t)$, then there are some τ_+ such that $u(\tau,t)\in \mathrm{Im}\ \iota_+$ for $\tau_+<\tau$, where ι_+ is the immersion with respect to γ_+. If we denote the ι_+ pull-back of (α,u) by

$$(\alpha,\theta_+,z_+):[\tau_+,\infty)\times[0,1]\to\mathbf{R}\times[0,1]\times\{z\in\mathbf{R}^{2n},|z|<\varepsilon\},$$

then there are some constants c_+, C^+_β and $d_+ > 0$ such that

$$\begin{aligned}|\partial^\beta[\alpha(\tau,t)-(T_+\tau+c_+)]| &\leq C^+_\beta e^{-d_+\tau},\\ |\partial^\beta[\theta_+(\tau,t)-t]| &\leq C^+_\beta e^{-d_+\tau},\\ |\partial^\beta z_+(\tau,t)| &\leq C^+_\beta e^{-d_+\tau}.\end{aligned}$$

Define $\mathcal{M}_I(p,q)$ to be the set of pseudo-holomorphic strips of the form (**I**) with (**1**) and (**1′**), also $\mathcal{M}_{II}(\gamma_-,p_+)$ of the form (**II**) with (**2**) and (**1′**), $\mathcal{M}_{II'}(p_-,\gamma_+)$ of the form (**II′**) with (**1**) and (**2′**), $\mathcal{M}_{III}(\gamma_-,\gamma_+)$ of the form (**III**) with (**2**) and (**2′**), $\mathcal{M}_{IV}(\gamma_-,\gamma_+)$ of the form (**IV**) with (**3**) and (**3′**), $\mathcal{M}_V(\gamma_-,\gamma_+)$ of the form (**V**) with (**2**) and (**3′**) and finally $\mathcal{M}_{V'}(\gamma_-,\gamma_+)$ of the form (**V′**) with (**3**) and (**2′**). Note that $\mathbf{R}$ acts on the moduli spaces of the type (**I**), (**II**), (**II′**) and (**III**) by $\frac{d}{da}(a*\overline{u})$, $a\in\mathbf{R}$.

On the other hand, for the moduli spaces of the type (**IV**), (**V**) and (**V′**), $\mathbf{R}^2$ acts on them by $\frac{d}{da}(a * \overline{u})$ for $(a,0) \in \mathbf{R}^2$ and $\frac{d}{db}(b\sharp\overline{u})$ for $(0,b) \in \mathbf{R}^2$, where $b\sharp\overline{u} := (\alpha - b, u)$ for $\overline{u} := (\alpha, u)$. We shall denote these quotients by $\hat{\mathcal{M}}_*(*,*)$.

First we recall the index for strips of the type (**I**) with (**1**) and (**1′**). (This part is so standard, the reader may skip to the next content.) Choose a trivialization $\{e_1^-, e_2^-, \ldots, e_{2n+1}^-, e_{2n+2}^-\}$ of $T_{p_-}X$ such that $\omega_{p_-}(e_{2i-1}^-, e_{2j}^-) = \delta_{ij}$, and similarly $\{e_1^+, e_2^+, \ldots, e_{2n+1}^+, e_{2n+2}^+\}$ of $T_{p_+}X$ such that $\omega_{p_+}(e_{2i-1}^+, e_{2j}^+) = \delta_{ij}$. We assume that our time-dependent almost complex structures J_t satisfy the following condition.

Assumption 2.3 *A time-dependent almost complex structure J_t, $t \in [0,1]$, satisfies that J_t on $T_{p_-}X$ is standard with respect to $\{e_1^-, e_2^-, \ldots, e_{2n+1}^-, e_{2n+2}^-\}$, i.e., $J_t e_{2i-1}^- = e_{2i}^-$ and $J_t e_{2i}^- = -e_{2i-1}^-$, and similarly J_t on $T_{p_+}X$ is standard with respect to $\{e_1^+, e_2^+, \ldots, e_{2n+1}^+, e_{2n+2}^+\}$.*

(We can always choose such almost complex structures.) Let $g(t)$, $t \in [0,1]$, be a time-dependent metric on X such that L_0 is totally geodesic with respect to $g(0)$ and similarly L_1 is totally geodesic with respect to $g(1)$. We denote by $\exp := \exp(t) : TX \to X$ the exponential map. Let $\overline{u} \in L_1^p(\mathbf{R}\times[0,1]; X, L_0, L_1)$ be a map satisfying the Lagrangian boundary conditions and (**I**) with the decay conditions (**1**) and (**1′**). ($\overline{u}$ need not be pseudo-holomorphic.) For $\eta \in L_1^p(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1)$, a section of $\overline{u}^*TX$ with $\eta(\tau,0) \in T_{\overline{u}(\tau,0)}L_0$ and $\eta(\tau,1) \in T_{\overline{u}(\tau,1)}L_1$, we define a map $f_{\overline{u}} : L_1^p(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p(\overline{u}^*TX \otimes \wedge^{0,1}T^*(\mathbf{R}\times[0,1]))$ by

$$f_{\overline{u}}(\eta) := \Phi_{\overline{u}}(\eta)^{-1}\overline{\partial}_{J_t}(\exp_{\overline{u}}(\eta)), \tag{2}$$

where $\Phi_{\overline{u}}(\eta) : T_{\overline{u}}X \to T_{\exp_{\overline{u}}}X$ denotes parallel transport of a connection along the geodesic $t \to \exp_{\overline{u}}(t\eta)$. The differential $Df_{\overline{u}}(0)$ is

$$Df_{\overline{u}}(0)\eta = \nabla_{\partial/\partial\tau}\eta + J_t(\overline{u}(\tau,t))\nabla_{\partial/\partial t}\eta + (\nabla_\eta J_t)\partial_t\overline{u}.$$

As $\tau \to -\infty$, the right hand side is

$$\nabla_{\partial/\partial\tau}\eta + J_t(p_-)\nabla_{\partial/\partial t}\eta, \tag{3}$$

and if we denote $\eta = \sum_{i=1}^{2n+2} \eta_i e_i^-$, then an equation (3) $= 0$ turns out to be

$$\frac{\partial}{\partial \tau}\begin{bmatrix} \eta_1 \\ \vdots \\ \eta_{2n+2} \end{bmatrix} + J_0 \frac{\partial}{\partial t}\begin{bmatrix} \eta_1 \\ \vdots \\ \eta_{2n+2} \end{bmatrix} = 0.$$

For simplicity we shall use $E_{\overline{u}}$ to denote $Df_{\overline{u}}(0)$ and put $E_{\overline{u}} = \frac{d}{d\tau} - Q_t$. Then we conclude that $Q_{-\infty}$ has no eigenvectors of eigenvalue 0 from Assumption 1.1. Similarly, as $\tau \to \infty$, Q_∞ also has no eigenvectors of eigenvalue 0. Since $Q_{-\infty}$ and Q_∞ are invertible, $E_{\overline{u}} : L_1^p(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p(\overline{u}^*TX \otimes \wedge^{0,1}T^*(\mathbf{R} \times [0,1]))$ is Fredholm. $\mathrm{Ind}E_{\overline{u}}$ denotes the index of $E_{\overline{u}}$.

Similarly we will introduce an index for strips of the type (**II**) with (**2**) and (**1′**). For Reeb chords $\gamma : [0,T] \to M$ we define $\overline{\gamma}(t) := \gamma(Tt)$. Consider the pull-back $\overline{\gamma}^*\xi$ over $\mathcal{I} := [0,1]$ and choose a trivialization $\{e_1, e_2, \dots, e_{2n}\}$ such that $e_i(t) = d\varphi_{Tt}e_i(0)$, $t \in [0,1]$, and $\overline{\gamma}^*d\lambda(e_{2i-1}(0), e_{2j}(0)) = \delta_{ij}$. Take a time-dependent connection $\nabla^\lambda := \nabla^\lambda(t)$, $t \in [0,1]$, on ξ so that the holonomy of $\overline{\gamma}^*\nabla^\lambda(t)$ agrees with $d\varphi_{Tt}$ along the Reeb chords, i.e., $\overline{\gamma}^*\nabla^\lambda(t)e_i(t) = 0$. Let $\{f_1, f_2, \dots, f_{2n}\}$ be another trivialization such that $\overline{\gamma}^*I_t(t)$ is the standard complex structure J_0 with respect to $\{f_1(t), f_2(t), \dots, f_{2n}(t)\}$, i.e., $\overline{\gamma}^*I_t(t)f_{2i-1}(t) = f_{2i}(t)$ and $\overline{\gamma}^*I_t(t)f_{2i-1}(t) = -f_{2i}(t)$. If $e_i(t) = \sum_{j=1}^{2n} a_{ij}(t)f_j(t)$ and $A := [a_{ij}(t)]$, then

$$\overline{\gamma}^*I_t\overline{\gamma}^*\nabla^\lambda_{\frac{\partial}{\partial t}}\sum_{i=1}^{2n}\eta_i(t)f_i(t) = [f_1f_2\cdots f_{2n}]\left\{J_0\frac{\partial}{\partial t}\begin{bmatrix} \eta_1 \\ \vdots \\ \eta_{2n} \end{bmatrix} - J_0\frac{\partial A}{\partial t}A^{-1}\begin{bmatrix} \eta_1 \\ \vdots \\ \eta_{2n} \end{bmatrix}\right\}.$$

We conclude that $-J_0\frac{\partial A}{\partial t}A^{-1}$ is symmetric if the complex structures satisfy the following condition.

Assumption 2.4 *A time-dependent complex structure I_t, $t \in [0,1]$, on ξ satisfies that $\overline{\gamma}^*d\lambda$ is standard with respect to $\{f_1(t), f_2(t), \dots, f_{2n}(t)\}$, i.e., $\overline{\gamma}^*d\lambda(f_{2i-1}(t), f_{2j}(t)) = \delta_{ij}$.*

(We can always choose ∇^λ and I_t as above. In fact, if we choose them so that $e_i(t) = f_i(t)$, then $a_{ij}(t) = \delta_{ij}$.) The double $\mathcal{I}'$ of $\mathcal{I}$ is the circle $\mathcal{I}' = \mathcal{I} \cup_{\partial\mathcal{I}} \overline{\mathcal{I}}$ where $\overline{\mathcal{I}}$ is the mirror image of $\mathcal{I}$ and corresponding points on the boundary are identified. We denote κ a natural involution. The doubling of $\overline{\gamma}^*\xi$ is completely similar. Let $\overline{\overline{\gamma}^*\xi}$ denote the vector bundle over $\overline{\mathcal{I}}$ whose fiber $(\overline{\overline{\gamma}^*\xi})_{\kappa(t)}$ is $(\overline{\gamma}^*\xi)_t$ with the complex structure $-\overline{\gamma}^*I_t(t)$. Then the double $\overline{\gamma}^*\xi'$ over $\mathcal{I}'$ is obtained by gluing $\overline{\gamma}^*\xi$ and $\overline{\overline{\gamma}^*\xi}$ along $\partial\mathcal{I}$. The identification is realized by the automorphism s of $\overline{\gamma}^*\xi|_{\partial\mathcal{I}}$ which is the anti-complex reflection through $T_{\gamma(0)}\Lambda_0$ over $\gamma(0)$ and through $T_{\gamma(T)}\Lambda_1$ over $\gamma(T)$. We denote $\overline{\gamma}^*I'_t$ the double of the complex structure on $\overline{\gamma}^*\xi'$ which is $\overline{\gamma}^*I_t$ on $\overline{\gamma}^*\xi$ and $-\overline{\gamma}^*I_t$ on $\overline{\overline{\gamma}^*\xi}$. An element $\eta' \in L^p_1(\overline{\gamma}^*\xi')$ is defined by $\eta'|_{\mathcal{I}} = \eta_1 \in L^p_1(\overline{\gamma}^*\xi)$ and $\tilde{\kappa}\circ(\eta'|_{\overline{\mathcal{I}}})\circ\kappa = \eta_2 \in L^p_1(\overline{\gamma}^*\xi)$, where $\tilde{\kappa}$ is the natural involution lifting κ. These satisfy $\eta_2|_{\partial\mathcal{I}} = s\circ(\eta_1|_{\partial\mathcal{I}})$ which is equivalent to

$$\begin{aligned} \eta_1+\eta_2 &\in L^p_1(\overline{\gamma}^*\xi; T_{\gamma(0)}\Lambda_0, T_{\gamma(T)}\Lambda_1),\\ \overline{\gamma}^*I_t(\eta_1-\eta_2) &\in L^p_1(\overline{\gamma}^*\xi; T_{\gamma(0)}\Lambda_0, T_{\gamma(T)}\Lambda_1). \end{aligned}$$

Conversely, any couple $(\eta_1,\eta_2) \in L^p_1(\overline{\gamma}^*\xi)\times L^p_1(\overline{\gamma}^*\xi)$ satisfying the above conditions defines $\eta' \in L^p_1(\overline{\gamma}^*\xi')$. We can now define the double operator $\overline{\gamma}^*\nabla^\lambda(t)'$ by $\overline{\gamma}^*\nabla^\lambda(t)$ on $\overline{\gamma}^*\xi$ and $\tilde{\kappa}\circ\overline{\gamma}^*\nabla^\lambda(t)\circ\kappa$ on $\overline{\overline{\gamma}^*\xi}$. We conclude that the holonomy around the circle $\mathcal{I}'$ is equal to $-\mathrm{id}$ from Assumption 2.2, and then the equation for sections $\eta'(t) \in L^p_1(\overline{\gamma}^*\xi')$

$$\overline{\gamma}^*I'_t\overline{\gamma}^*\nabla^\lambda_{\frac{\partial}{\partial t}}(t)'\eta'(t) = 0$$

has no eigen functions of eigen value 0.

Let $\nabla := \nabla(t)$ be a time-dependent connection on TX which, out side a compact set, is of the form: the restriction on E is trivial, i.e., $\nabla(a\frac{\partial}{\partial\theta}+bX_\lambda) = da\otimes\frac{\partial}{\partial\theta}+db\otimes X_\lambda$, and the restriction on ξ is the pull-back of ∇^λ. Similarly, a time-dependent almost complex structure J_t on X, out side a compact set, is of the form $\overline{I_t}$. Let $\overline{u}$ be a map which satisfies the Lagrangian boundary conditions and (**II**) and the decay condition (**2**). ($\overline{u}$ need not be pseudo-holomorphic.) Then, the differential $Df_{\overline{u}}(0)$ is

$$Df_{\overline{u}}(0)\eta = \nabla_{\partial/\partial\tau}\eta + J(\overline{u}(\tau,t))\nabla_{\partial/\partial t}\eta + (\nabla_\eta J)\partial_t\overline{u}.$$

As $\tau \to -\infty$, the right hand side is

$$\nabla_{\partial/\partial\tau}\eta + \overline{I_t}(\gamma_-(T_-t))\nabla_{\partial/\partial t}\eta, \tag{4}$$

and if we denote $\eta = \eta_1 \frac{\partial}{\partial\theta} + \eta_2 X_\lambda + \sum_{i=3}^{2n+2} \eta_i f_i$, then an equation (4) = 0 splits into

$$\frac{\partial}{\partial\tau}\begin{bmatrix}\eta_1\\ \eta_2\end{bmatrix} + \begin{bmatrix}0 & -1\\ 1 & 0\end{bmatrix}\frac{\partial}{\partial t}\begin{bmatrix}\eta_1\\ \eta_2\end{bmatrix} = 0,$$

$$\frac{\partial}{\partial\tau}\begin{bmatrix}\eta_3\\ \vdots\\ \eta_{2n+2}\end{bmatrix} + J_0\frac{\partial}{\partial t}\begin{bmatrix}\eta_3\\ \vdots\\ \eta_{2n+2}\end{bmatrix} - J_0\frac{\partial A}{\partial t}A^{-1}\begin{bmatrix}\eta_3\\ \vdots\\ \eta_{2n+2}\end{bmatrix} = 0.$$

If we consider the double operator of $E_{\overline{u}}$ on $\mathbf{R}\times S^1 := (\mathbf{R}\times[0,1])\cup_{\partial(\mathbf{R}\times[0,1])} (\mathbf{R}\times[0,1])$ (the double is exactly similar to that in the last paragraph), then $Q_{-\infty}$ has eigenvectors $(\eta_1,\eta_2,\eta_3,\dots,\eta_{2n+2}) = (1,0,0,\dots,0)$ and $(0,1,0,\dots,0)$ of eigenvalue 0. (If we simply consider $E_{\overline{u}}$ on $\mathbf{R}\times[0,1]$, then $Q_{-\infty}$ on $\mathcal{I}$ has an eigenvector $(1,0,\dots,0)$ of eigenvalue 0 under the Lagrangian boundary conditions.)

Now we introduce weighted Sobolev spaces for the Fredholm theory of $E_{\overline{u}}$. For $0<\delta<2\pi$ and τ_- as in the decay condition (**2**), we define a smooth decreasing function σ by

$$\sigma(\tau) := \begin{cases} -\delta(\tau-\tau_-+1), & \tau\le\tau_- - 2,\\ 0, & \tau_-\le\tau,\end{cases}$$

and a cut function $\beta:\mathbf{R}\to[0,1]$ by

$$\beta(\tau) := \begin{cases} 1, & \tau\le\tau_- - 1,\\ 0, & \tau_-\le\tau.\end{cases}$$

For a section η of $\overline{u}^*TX|_{(-\infty,\tau_-]\times M}$, we denote $\eta=\eta_E+\eta_\xi$, where η_E is the E component and η_ξ is the ξ component. Then we define weighted Sobolev norms by

$$\begin{aligned}\|\eta\|_{L^p_{1;\sigma}} := \Bigg\{&\int_{[\tau_-,\infty)\times[0,1]}(1-\beta(\tau))(|\eta|^p+|\nabla\eta|^p)d\tau dt\\ &+\int_{(-\infty,\tau_-]\times[0,1]} e^{\sigma(\tau)}\beta(\tau)(|\eta_E|^p+|\nabla\eta_E|^p)+\beta(\tau)(|\eta_\xi|^p+|\nabla\eta_\xi|^p)d\tau dt\Bigg\}^{1/p},\end{aligned}$$

and similarly

$$\|\eta\|_{L^p_{0;\sigma}} := \left\{\int_{[\tau_-,\infty)\times[0,1]}(1-\beta(\tau))|\eta|^p d\tau dt + \int_{(-\infty,\tau_-]\times[0,1]} e^{\sigma(\tau)}\beta(\tau)|\eta_E|^p+\beta(\tau)|\eta_\xi|^p d\tau dt\right\}^{1/p}.$$

We define $L^p_{1;\sigma}$ to be the set of sections f such that $\|f\|_{L^p_{1;\sigma}} < \infty$, and also $L^p_{0;\sigma}$. Let $I : L^2 \to L^2_{0;\sigma}$ be the following isometric transformation.

$$I(\eta)(\tau,t) := \begin{cases} e^{-\sigma(\tau)/2}\eta_E + \eta_\xi, & \tau \leq \tau_- \\ \eta, & \tau_- \leq \tau \end{cases}$$

Then we obtain

$$E_{\overline{u};\sigma}(\eta)(\tau,t) := I^{-1}E_{\overline{u}}I(\eta)(\tau,t) = (E_{\overline{u}}\eta)(\tau,t) - \frac{1}{2}\frac{d\sigma}{d\tau}\eta_E.$$

As $\tau \to -\infty$, $E_{\overline{u};\sigma}$ is equal to

$$\frac{\partial}{\partial\tau} - Q_{-\infty} + \frac{\delta}{2}\pi_E.$$

Since $-Q_{-\infty} + \frac{\delta}{2}\pi_E$ is invertible (and Q_∞ is also invertible, see the last paragraph), $E_{\overline{u};\sigma} : L^2_1 \to L^2$ is a Fredholm operator, which implies that $E_{\overline{u}} : L^2_{1;\sigma} \to L^2_{0;\sigma}$ is Fredholm. $\mathrm{Ind}E_{\overline{u};\sigma}$ denotes the index of $E_{\overline{u};\sigma}$. Note that, if $\overline{u}$ is pseudo-holomorphic, then $E_{\overline{u}}\frac{d}{da}(a*\overline{u})|_{a=0} = 0$. But $\frac{d}{da}(a*\overline{u})|_{a=0}$ is not an element of $L^p_{1;\sigma}$, because $\frac{d}{da}(a*\overline{u})|_{a=0}$, as $\tau \to -\infty$, is close to $-T_-(\frac{\partial}{\partial\alpha})$ which is not in $L^p_{1;\sigma}$. On the other hand a map $E_{\overline{u}} : \langle\frac{d}{da}(a*\overline{u})|_{a=0}\rangle \to L^p_{0;\sigma}$ makes sense, hence we use the same notation $E_{\overline{u}} : \langle\frac{d}{da}(a*\overline{u})|_{a=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$. (The tangent space of $\mathcal{M}_{II}(\gamma_-, p_+)$ at a smooth point $\overline{u}$ is $\mathrm{Ker}\{E_{\overline{u}} : \langle\frac{d}{da}(a*\overline{u})|_{a=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$.) $\mathrm{Ind}E_{\overline{u}}$ denotes the index of $E_{\overline{u}} : \langle\frac{d}{da}(a*\overline{u})|_{a=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$. (Hence $\mathrm{Ind}E_{\overline{u}} = \mathrm{Ind}E_{\overline{u};\sigma} + 1$.)

Similarly we can introduce weighted Sobolev spaces and indexes for strips of the type (**II′**) and (**III**).

For strips of the type (**IV**) we can also define weighted Sobolev spaces and indexes $\mathrm{Ind}E_{\overline{u};\sigma}$ for $E_{\overline{u};\sigma} : L^p_1 \to L^p$. Note that, if $\overline{u} := (\alpha, u)$ is pseudo-holomorphic strip of the type (**IV**), then $E_{\overline{u}}\frac{d}{da}(a*\overline{u})|_{a=0} = 0$. But $\frac{d}{da}(a*\overline{u})|_{a=0}$ is not an element of $L^p_{1;\sigma}$, because $\frac{d}{da}(a*\overline{u})|_{a=0}$, as $\tau \to -\infty$, is close to $T_-(\frac{\partial}{\partial\alpha})$ and, as $\tau \to \infty$, is close to $-T_+(\frac{\partial}{\partial\alpha})$ which is not in $L^p_{1;\sigma}$. Also $E_{\overline{u}}\frac{d}{db}(b\sharp\overline{u})|_{b=0} = 0$. But $\frac{d}{db}(b\sharp\overline{u})|_{b=0}$ is also not an element of $L^p_{1;\sigma}$, because $\frac{d}{db}(b\sharp\overline{u})|_{b=0}$, as $\tau \to -\infty$, is close to $-(\frac{\partial}{\partial\alpha})$ and, $\tau \to \infty$, is also close to $-(\frac{\partial}{\partial\alpha})$ which is not in $L^p_{1;\sigma}$. On the other hand a map $E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}, \frac{d}{db}(b\sharp\overline{u})|_{b=0}\rangle \to L^p_{0;\sigma}$ makes sense, hence we use the same notation $E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}, \frac{d}{db}(b\sharp\overline{u})|_{b=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$. (The tangent space of $\mathcal{M}_{IV}(\gamma_-, \gamma_+)$ at a smooth point $\overline{u}$ is $\mathrm{Ker}\{E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}, \frac{d}{db}(b\sharp\overline{u})|_{b=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)\}$.) $\mathrm{Ind}E_{\overline{u}}$ denotes the index of $E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}, \frac{d}{db}(b\sharp\overline{u})|_{b=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$. (Then $\mathrm{Ind}E_{\overline{u}} = \mathrm{Ind}E_{\overline{u};\sigma} + 2$.)

3 Floer's chain complexes for Lagrangian submanifolds in symplectic manifolds with concave/convex ends

We will propose Floer's chain complexes for Lagrangian submanifolds in symplectic manifolds with concave/convex ends.

Let X be a symplectic manifold with finitely many concave or convex ends. We shall assume that the contact manifolds are compact without boundaries. Let L_0 and L_1 be Lagrangian submanifolds in X which satisfy Assumption 1.1, 2.1 and 2.2.

Assumption 3.1 *For pseudo-holomorphic strips* $\overline{u}$ *of the type* (**I**) *the linear operators* $E_{\overline{u}} : L^p_1(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p(\overline{u}^*TX)$ *are surjective, and for pseudo-holomorphic strips* $\overline{u}$ *of the type* (**II**), (**II′**) *and* (**III**) *the linear operators* $E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$ *are also surjective, and pseudo-holomorphic strips* $\overline{u}$ *of the type* (**IV**), (**V**) *and* (**V′**) *the linear operators* $E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}, \frac{d}{db}(b\sharp\overline{u})|_{b=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*TL_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$ *are surjective.*

(The surjectivity or transversality problem will be observed in a forthcoming paper [2].) From the above assumption we can conclude that the moduli spaces $\mathcal{M}_*(*, *)$ are smooth manifolds whose dimension at $\overline{u}$ is equal to $\mathrm{Ind}E_{\overline{u}}$, and $\hat{\mathcal{M}}_*(*, *)$ are also smooth manifolds whose dimension at $\overline{u}$ is equal to $\mathrm{Ind}E_{\overline{u}} - 1$ for the type (**I**), (**II**), (**II′**) and (**III**), and $\mathrm{Ind}E_{\overline{u}} - 2$ for the type (**IV**), (**V**) and (**V′**). We denote a subset of $\mathcal{M}_*(*, *)$ or $\hat{\mathcal{M}}_*(*, *)$ consists of the pseudo-holomorphic strips whose dimension is d by $\mathcal{M}^d_*(*, *)$ or $\hat{\mathcal{M}}^d_*(*, *)$, respectively.

For appropriate compactifications of moduli spaces we need Assumption 1.2, 1.4 and the following.

Assumption 3.2 *There are no contractible closed characteristics and contractible Reeb chords from a Legendrian submanifold to itself in the contact manifolds of concave ands.*

A closed characteristic in M is contractible iff it represents 0 in $\pi_1(M)$, and similarly a Reeb chord from Λ to Λ is contractible iff it represents 0 of $\pi_1(M, \Lambda)$.

Moreover, for very technical reasons for the exponential decay conditions, we need the following assumption.

Assumption 3.3 *There is an open neighborhood $U \subset [0,1] \times \mathbf{R}^{2n}$ of $[0,1] \times \{0\}$ and an open neighborhood $V \subset M$ of a Reeb chord $x(Tt)$ of length T and an immersion $\varphi : U \to V$ mapping $[0,1] \times \{0\}$ onto $x(Tt)$ such that $\varphi^*\lambda = f\lambda_0$ with $\lambda_0 := dt + \sum_{i=1}^n x_n dy_n$ and a positive smooth function $f : U \to \mathbf{R}$ satisfying $f(t,0,0) = T$ and $df(t,0,0) = 0$ for all $t \in [0,1]$.*

From these assumptions we can conclude that.

Theorem 3.4 *$\hat{\mathcal{M}}^0_*(*,*)$ is compact, and $\hat{\mathcal{M}}^1_*(*,*)$ can be compactified whose boundaries are:*

(**a**) $$\begin{aligned} \partial\hat{\mathcal{M}}^1_I(p_-,p_+) &= \bigcup_{q\in L_0\cap L_1} \hat{\mathcal{M}}^0_I(p_-,q) \times \hat{\mathcal{M}}^0_I(q,p_+) \\ &\cup \bigcup_{(\gamma_-,\gamma_+)} \hat{\mathcal{M}}^0_{II'}(p_-,\gamma_-) \times \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+) \times \hat{\mathcal{M}}^0_{II}(\gamma_+,p_+), \end{aligned}$$

(**b**) $$\begin{aligned} \partial\hat{\mathcal{M}}^1_{II}(\gamma_-,p_+) &= \bigcup_{q\in L_0\cap L_1} \hat{\mathcal{M}}^0_{II}(\gamma_-,q) \times \hat{\mathcal{M}}^0_I(q,p_+) \\ &\cup \bigcup_{(\gamma'_-,\gamma'_+)} \hat{\mathcal{M}}^0_{III}(\gamma_-,\gamma'_-) \times \hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+) \times \hat{\mathcal{M}}^0_{II}(\gamma'_+,p_+) \\ &\cup \bigcup_{\gamma} \hat{\mathcal{M}}^0_V(\gamma_-,\gamma) \times \hat{\mathcal{M}}^0_{II}(\gamma,p_+), \end{aligned}$$

(**b′**) $$\begin{aligned} \partial\hat{\mathcal{M}}^1_{II'}(p_-,\gamma_+) &= \bigcup_{q\in L_0\cap L_1} \hat{\mathcal{M}}^0_I(p_-,q) \times \hat{\mathcal{M}}^0_{II'}(q,\gamma_+) \\ &\cup \bigcup_{(\gamma'_-,\gamma'_+)} \hat{\mathcal{M}}^0_{II'}(p_-,\gamma'_-) \times \hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+) \times \hat{\mathcal{M}}^0_{III}(\gamma'_+,\gamma_+) \\ &\cup \bigcup_{\gamma} \hat{\mathcal{M}}^0_{II'}(p_-,\gamma) \times \hat{\mathcal{M}}^0_{V'}(\gamma,\gamma_+), \end{aligned}$$

$$
\begin{aligned}
(\mathbf{c})\ \partial\hat{\mathcal{M}}^1_{III}(\gamma_-,\gamma_+) \;=\; & \bigcup_{q\in L_0\cap L_1} \hat{\mathcal{M}}^0_{II}(\gamma_-,q)\times\hat{\mathcal{M}}^0_{II'}(q,\gamma_+) \\
& \cup \bigcup_{(\gamma'_-,\gamma'_+)} \hat{\mathcal{M}}^0_{III}(\gamma_-,\gamma'_-)\times\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)\times\hat{\mathcal{M}}^0_{III}(\gamma'_+,\gamma_+) \\
& \cup\bigcup_{\gamma}\hat{\mathcal{M}}^0_{V}(\gamma_-,\gamma)\times\hat{\mathcal{M}}^0_{III}(\gamma,\gamma_+)\cup\bigcup_{\gamma}\hat{\mathcal{M}}^0_{III}(\gamma_-,\gamma)\times\hat{\mathcal{M}}^0_{V'}(\gamma,\gamma_+),
\end{aligned}
$$

where we used the notation $\partial\hat{\mathcal{M}}^1_*(*,*)$ *to denote the boundary of the compactification of* $\hat{\mathcal{M}}^1_*(*,*)$.

Note that, from the maximum principle, families of pseudo-holomorphic curves can not grow toward $+\infty$ of convex ends, see Section 5.

Let C be the free $\mathbf{Z}_2$-vector space over $L_0\cap L_1$ and $\bigcup_{(\gamma_-,\gamma_+)}\hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)$. We define a linear map $\partial : C\to C$ in terms of the canonical bases: for $p_-\in L_0\cap L_1$

$$
\partial p_- := \sum_{p_+\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{I}(p_-,p_+)p_+ + \sum_{\substack{(\gamma_-,\gamma_+),\\ u\in\hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)}}\sharp\hat{\mathcal{M}}^0_{II'}(p_-,\gamma_-)u,
$$

where $\sharp\hat{\mathcal{M}}^0_I(p_-,p_+)$ is the modulo 2 number of the elements of $\hat{\mathcal{M}}^0_I(p_-,p_+)$ and similarly where $\sharp\hat{\mathcal{M}}^0_{II'}(p_-,\gamma_-)$ is the modulo 2 number of the elements of $\hat{\mathcal{M}}^0_{II'}(p_-,\gamma_-)$ and the second sum ranges over all pairs of Reeb chords (γ_-,γ_+) with respect to the concave ends. and for $u\in\hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)$

$$
\partial u := \sum_{p_+\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p_+)p_+ + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v\in\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}}\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)v,
$$

where $\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p_+)$ is the modulo 2 number of the elements of $\hat{\mathcal{M}}^0_{II}(\gamma_+,p_+)$ and similarly where $\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)$ is the modulo 2 number of the elements of $\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)$ and the second sum ranges over all pairs of Reeb chords (γ'_-,γ'_+) with respect to the concave ends.

Assumption 3.5 *There are no non-trivial pseudo-holomorphic strips of the type* (**V**) *and* (**V**$'$).

(It seems that the existence of non-trivial pseudo-holomorphic strips of the type (**V**) and (**V**$'$) is an obstruction to $\partial^2=0$.) Then, we can prove

Theorem 3.6 $\partial \circ \partial = 0$.

Proof. For $p \in L_0 \cap L_1$

$$\begin{aligned}
\partial\partial p &= \partial \sum_{q \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_I(p,q)q + \partial \sum_{\substack{(\gamma_-,\gamma_+),\\ u \in \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)}} \sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma_-)u \\
&= \sum_{q \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_I(p,q) \left(\sum_{r \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_I(q,r)r + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v \in \hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}} \sharp\hat{\mathcal{M}}^0_{II'}(q,\gamma'_-)v \right) \\
&\quad + \sum_{\substack{(\gamma_-,\gamma_+),\\ u \in \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)}} \sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma_-) \left(\sum_{r \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,r)r + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v \in \hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}} \sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)v \right) \\
&= \sum_{r \in L_0 \cap L_1} \left(\sum_{q \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_I(p,q)\sharp\hat{\mathcal{M}}^0_I(q,r) + \sum_{\substack{(\gamma_-,\gamma_+),\\ u \in \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)}} \sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma_-)\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,r) \right) r \\
&+ \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v \in \hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}} \left(\sum_{q \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_I(p,q)\sharp\hat{\mathcal{M}}^0_{II'}(q,\gamma'_-) + \sum_{\substack{(\gamma_-,\gamma_+),\\ u \in \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)}} \sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma_-)\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-) \right) v.
\end{aligned}$$

The number

$$\sum_{q \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_I(p,q)\sharp\hat{\mathcal{M}}^0_I(q,r) + \sum_{\substack{(\gamma_-,\gamma_+),\\ u \in \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)}} \sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma_-)\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,r)$$

is nothing but the one of the boundary components of the compactification of $\hat{\mathcal{M}}^1_I(p,r)$, and similarly the number

$$\sum_{q \in L_0 \cap L_1} \sharp\hat{\mathcal{M}}^0_I(p,q)\sharp\hat{\mathcal{M}}^0_{II'}(q,\gamma'_-) + \sum_{\substack{(\gamma_-,\gamma_+),\\ u \in \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)}} \sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma_-)\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)$$

is the one of the boundary components of the compactification of $\hat{\mathcal{M}}^1_{II'}(p,\gamma'_-)$, and hence $\partial\partial p = 0$. For $u \in \hat{\mathcal{M}}^0_{IV}(\gamma_-,\gamma_+)$

$$\begin{aligned}
\partial\partial u &= \partial \sum_{p\in L_0\cap L_1} \sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p)p + \partial \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v\in\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}} \sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)v \\
&= \sum_{p\in L_0\cap L_1} \sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p)\left(\sum_{q\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{I}(p,q)q + \sum_{\substack{(\gamma''_-,\gamma''_+),\\ w\in\hat{\mathcal{M}}^0_{IV}(\gamma''_-,\gamma''_+)}}\sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma''_-)w\right) \\
&\quad + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v\in\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}} \sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)\left(\sum_{q\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{II}(\gamma'_+,q)q + \sum_{\substack{(\gamma''_-,\gamma''_+),\\ w\in\hat{\mathcal{M}}^0_{IV}(\gamma''_-,\gamma''_+)}}\sharp\hat{\mathcal{M}}^0_{III}(\gamma'_+,\gamma''_-)w\right) \\
&= \sum_{q\in L_0\cap L_1}\left(\sum_{p\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p)\sharp\hat{\mathcal{M}}^0_{I}(p,q) + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v\in\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}}\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)\sharp\hat{\mathcal{M}}^0_{II}(\gamma'_+,q)\right)q \\
&\quad + \sum_{\substack{(\gamma''_-,\gamma''_+),\\ w\in\hat{\mathcal{M}}^0_{IV}(\gamma''_-,\gamma''_+)}}\left(\sum_{p\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p)\sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma''_-) + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v\in\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}}\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)\sharp\hat{\mathcal{M}}^0_{III}(\gamma'_+,\gamma''_-)\right)w.
\end{aligned}$$

The number

$$\sum_{p\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p)\sharp\hat{\mathcal{M}}^0_{I}(p,q) + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v\in\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}}\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)\sharp\hat{\mathcal{M}}^0_{II}(\gamma'_+,q)$$

is nothing but the one of the boundary components of the compactification of $\hat{\mathcal{M}}^1_{II}(\gamma_+,q)$, and similarly the number

$$\sum_{p\in L_0\cap L_1}\sharp\hat{\mathcal{M}}^0_{II}(\gamma_+,p)\sharp\hat{\mathcal{M}}^0_{II'}(p,\gamma''_-) + \sum_{\substack{(\gamma'_-,\gamma'_+),\\ v\in\hat{\mathcal{M}}^0_{IV}(\gamma'_-,\gamma'_+)}}\sharp\hat{\mathcal{M}}^0_{III}(\gamma_+,\gamma'_-)\sharp\hat{\mathcal{M}}^0_{III}(\gamma'_+,\gamma''_-)$$

is the one of the boundary components of the compactification of $\hat{\mathcal{M}}^1_{III}(\gamma_+, \gamma''_-)$, and hence $\partial\partial u = 0$. ∎

We obtain the chain complex (C, ∂) for L_0 and L_1 in X. If complex structures on contact structures vary, then the set $\bigcup_{(\gamma_-,\gamma_+)} \hat{\mathcal{M}}^0_{IV}(\gamma_-, \gamma_+)$ may change. This implies that the generators of the type $\bigcup_{(\gamma_-,\gamma_+)} \hat{\mathcal{M}}^0_{IV}(\gamma_-, \gamma_+)$ may appear and disappear, hence, at the time of this writing, the author does not know whether the homology is invariant under the variation of complex structures on contact structures. Concerning Assumption 3.2 and 3.5, he hopes that there are some relations between symplectic field theory [3] and our chain complexes.

Similarly we can construct Floer's chain complexes for periodic orbits of Hamiltonian flows on symplectic manifolds with concave ends, which will appear in a forthcoming paper.

4 Gluing arguments for pseudo-holomorphic strips

For our purpose we need the following gluing arguments. (We will define the notation soon later.)

Theorem 4.1 *For the compactification of the type* (**a**) *as in Theorem 3.4 we need the following* (**i**) *and* (**ii**)*:*

(**i**) *Let* $\hat{K} \subset \hat{\mathcal{M}}^0_I(p_-, q)$ *and* $\hat{K}' \subset \hat{\mathcal{M}}^0_I(q, p_+)$ *be compact sets. Then there exist constants* ρ_0 *and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_I(p_-, p_+).$$

Moreover, for $\overline{u}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$ *and* $\hat{K}'$*, there exist* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_I(p_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$ *is contained in the image of* $\hat{\sharp}$*.*

(**ii**) *Let* $\hat{K} \subset \hat{\mathcal{M}}^0_{II'}(p_-, \gamma_-)$*,* $\hat{K}' \subset \hat{\mathcal{M}}^0_{IV}(\gamma_-, \gamma_+)$ *and* $\hat{K}'' \subset \hat{\mathcal{M}}^0_{II}(\gamma_+, p_+)$ *be compact subsets. Then there exist constants* ρ_0 *and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times \hat{K}'' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_I(p_-, p_+).$$

Moreover, for $\overline{u}$, $\overline{w}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$, $\hat{K}'$ *and* $\hat{K}''$, *there exist* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_I(p_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v})$ *is contained in the image of* $\hat{\sharp}$.

For the type (**b**) *we need the following* (**iii**), (**iv**) *and* (**v**)*:*

(**iii**) *Let* $\hat{K} \subset \hat{\mathcal{M}}^0_{II}(\gamma_-, q)$ *and* $\hat{K}' \subset \hat{\mathcal{M}}^0_I(q, p_+)$ *be compact sets. Then there exist constants* ρ_0 *and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+).$$

Moreover, for $\overline{u}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$ *and* $\hat{K}'$, *there exist* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_{II}(\gamma_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$ *is contained in the image of* $\hat{\sharp}$.

(**iv**) *Let* $\hat{K} \subset \hat{\mathcal{M}}^0_{III}(\gamma_-, \gamma'_-)$, $\hat{K}' \subset \hat{\mathcal{M}}^0_{IV}(\gamma'_-, \gamma'_+)$ *and* $\hat{K}'' \subset \hat{\mathcal{M}}^0_{II}(\gamma'_+, p_+)$ *be compact subsets. Then there exist constants* ρ_0 *and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times \hat{K}'' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+).$$

Moreover, for $\overline{u}$, $\overline{w}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$, $\hat{K}'$ *and* $\hat{K}''$, *there exist* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_{II}(\gamma_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v})$ *is contained in the image of* $\hat{\sharp}$.

(**v**) *Let* $\hat{K} \subset \hat{\mathcal{M}}^0_V(\gamma_-, \gamma)$ *and* $\hat{K}' \subset \hat{\mathcal{M}}^0_{II}(\gamma, p_+)$ *be compact sets. Then there exist constants* ρ_0 *and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+).$$

Moreover, for $\overline{u}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$ *and* $\hat{K}'$, *there exists* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_{II}(\gamma_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$ *is contained in the image of* $\hat{\sharp}$.

For the type (**b′**) *we need the following* (**iii′**), (**iv′**) *and* (**v′**)*:*

(**iii′**) *Let* $\hat{K} \subset \hat{\mathcal{M}}^0_I(p_-, q)$ *and* $\hat{K}' \subset \hat{\mathcal{M}}^0_{II'}(q, \gamma_+)$ *be compact sets. Then there exist constants* ρ_0 *and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II'}(p_-, \gamma_+).$$

Moreover, for $\overline{u}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$ *and* $\hat{K}'$, *there exists* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_{II'}(p_-, \gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$ *is contained in the image of* $\hat{\sharp}$.

(**iv′**) *Let $\hat{K} \subset \hat{\mathcal{M}}^0_{II'}(p_-, \gamma'_-)$, $\hat{K}' \subset \hat{\mathcal{M}}^0_{IV}(\gamma'_-, \gamma'_+)$ and $\hat{K}'' \subset \hat{\mathcal{M}}^0_{III}(\gamma'_+, \gamma_+)$ be compact subsets. Then there exist constants ρ_0 and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times \hat{K}'' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II'}(p_-, \gamma_+).$$

Moreover, for $\overline{u}$, $\overline{w}$ and $\overline{v}$ in the interior of $\hat{K}$, $\hat{K}'$ and $\hat{K}''$, there exist $\varepsilon > 0$ and ρ so that $\hat{\mathcal{M}}^1_{II'}(p_-, \gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v})$ is contained in the image of $\hat{\sharp}$.

(**v′**) *Let $\hat{K} \subset \hat{\mathcal{M}}^0_{II'}(p_-, \gamma)$ and $\hat{K}' \subset \hat{\mathcal{M}}^0_{V'}(\gamma, \gamma_+)$ be compact sets. Then there exist constants ρ_0 and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II'}(p_-, \gamma_+).$$

Moreover, for $\overline{u}$ and $\overline{v}$ in the interior of $\hat{K}$ and $\hat{K}'$, there exists $\varepsilon > 0$ and ρ so that $\hat{\mathcal{M}}^1_{II'}(p_-, \gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$ is contained in the image of $\hat{\sharp}$.

For the type (**c**) *we need the following* (**vi**), (**vii**) *and* (**vii′**)*:*

(**vi**) *Let $\hat{K} \subset \hat{\mathcal{M}}^0_{II}(\gamma_-, q)$ and $\hat{K}' \subset \hat{\mathcal{M}}^0_{II'}(q, \gamma_+)$ be compact sets. Then there exist constants ρ_0 and a smooth map*

$$\sharp : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+).$$

Moreover, for $\overline{u}$ and $\overline{v}$ in the interior of $\hat{K}$ and $\hat{K}'$, there exists $\varepsilon > 0$ and ρ so that $\hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$ is contained in the image of $\hat{\sharp}$.

(**vii**) *Let $\hat{K} \subset \hat{\mathcal{M}}^0_{III}(\gamma_-, \gamma'_-)$, $\hat{K}' \subset \hat{\mathcal{M}}^0_{IV}(\gamma'_-, \gamma'_+)$ and $\hat{K}'' \subset \hat{\mathcal{M}}^0_{III}(\gamma'_+, \gamma_+)$ be compact subsets. Then there exist constants ρ_0 and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times \hat{K}'' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+).$$

Moreover, for $\overline{u}$, $\overline{w}$ and $\overline{v}$ in the interior of $\hat{K}$, $\hat{K}'$ and $\hat{K}''$, there exist $\varepsilon > 0$ and ρ so that $\hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v})$ is contained in the image of $\hat{\sharp}$.

(**viii**) *Let $\hat{K} \subset \hat{\mathcal{M}}^0_{V}(\gamma_-, \gamma)$ and $\hat{K}' \subset \hat{\mathcal{M}}^0_{III}(\gamma, \gamma_+)$ be compact sets. Then there exist constants ρ_0 and a smooth map*

$$\sharp : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+).$$

Moreover, for $\overline{u}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$ *and* $\hat{K}'$*, there exists* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_{III}(\gamma_-,\gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u},\overline{v})$ *is contained in the image of* $\hat{\sharp}$*.*

(**viii′**) *Let* $\hat{K} \subset \hat{\mathcal{M}}^0_{III}(\gamma_-,\gamma)$ *and* $\hat{K}' \subset \hat{\mathcal{M}}^0_{V'}(\gamma,\gamma_+)$ *be compact sets. Then there exist constants* ρ_0 *and a smooth map*

$$\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0,\infty) \to \hat{\mathcal{M}}^1_{III}(\gamma_-,\gamma_+).$$

Moreover, for $\overline{u}$ *and* $\overline{v}$ *in the interior of* $\hat{K}$ *and* $\hat{K}'$*, there exists* $\varepsilon > 0$ *and* ρ *so that* $\hat{\mathcal{M}}^1_{III}(\gamma_-,\gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u},\overline{v})$ *is contained in the image of* $\hat{\sharp}$*.*

In the following we denote by $\beta : \mathbf{R} \to [0,1]$ a smooth function

$$\beta(\tau) := \begin{cases} 0, & \tau \le 0, \\ 1, & 1 \le \tau, \end{cases}$$

and by $\|f\|_{[r_1,r_2];L^p_1}$ the restriction of the L^p_1 norm on $[r_1,r_2]\times[0,1]$, i.e., $\|f\|_{[r_1,r_2];L^p_1} := \{\int_{[r_1,r_2]\times[0,1]} |f|^p + |Df|^p d\tau dt\}^{1/p}$, and also $\|f\|_{[r_1,r_2];L^p}$.

First we recall the proof of the gluing argument (**i**). (This part is so standard, the reader may skip to the next content.) For compact sets $K \subset \mathcal{M}^1_I(p_-,q)$ and $K' \subset \mathcal{M}^1_I(q,p_+)$, we define $w_\chi(\tau,t) \in L^p_1(\mathbf{R}\times[0,1];X,L_0,L_1)$ for $\chi := (\overline{u},\overline{v},\rho) \in K \times K' \times [\rho_0,\infty)$ by

$$w_\chi(\tau,t) := \begin{cases} \overline{u}(\tau+\rho,t), & \tau \le -1, \\ \exp_q\left(\beta(-\tau)\eta(\tau+\rho,t) + \beta(\tau)\zeta(\tau-\rho,t)\right), & -1 \le \tau \le 1, \\ \overline{v}(\tau-\rho,t), & 1 \le \tau, \end{cases}$$

where $\overline{u} = \exp_q \eta$ for $\rho - 1 \le \tau$ and $\overline{v} = \exp_q \zeta$ for $\tau \le -\rho+1$. From $\overline{\partial}_J\overline{u} = \overline{\partial}_J\overline{v} = 0$ we conclude that

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p} \le C\left(e^{-d_+\rho}\|e^{d_+\tau}\eta\|_{[\rho-1,\rho];L^p_1} + e^{-d_-\rho}\|e^{-d_-\tau}\zeta\|_{[-\rho,1-\rho];L^p_1}\right), \quad (5)$$

where C is a constant depending only on K, K' and ρ_0. We denote the Taylor expansion of $f_{w_\chi}$by

$$f_{w_\chi}(\xi) := f_{w_\chi}(0) + Df_{w_\chi}(0)\xi + N_{w_\chi}(\xi).$$

Lemma 4.2 *For* $\|\eta\|_{L^p_1} \leq c$ *and* $\|\zeta\|_{L^p_1} \leq c$, *the nonlinear part* N_{w_χ} *satisfies the estimate*

$$\|N_{w_\chi}(\eta) - N_{w_\chi}(\zeta)\|_{L^p} \leq C(\|\eta\|_{L^p_1} + \|\zeta\|_{L^p_1})\|\eta - \zeta\|_{L^p_1}, \tag{6}$$

where C *is a constant depending only on* $\|\nabla w_\chi\|_{L^p}$ *and* c.

Proof. Basically it is done by the Taylor expansion. (In the following we shall use f to denote f_{w_χ}.)

$$\begin{aligned}
& N_{w_\chi}(\eta) - N_{w_\chi}(\zeta) \\
= & \int_0^1 (1-t)\{(d^2f)_{t\eta}(\eta,\eta) - (d^2f)_{t\zeta}(\zeta,\zeta)\}dt \\
= & \int_0^1 (1-t)\{(d^2f)_{t\eta}(\eta,\eta-\zeta) + (d^2f)_{t\eta}(\eta,\zeta) - (d^2f)_{t\zeta}(\eta,\zeta) + (d^2f)_{t\zeta}(\eta-\zeta,\zeta)\}dt \\
= & \int_0^1 (1-t)\left\{(d^2f)_{t\eta}(\eta,\eta-\zeta) + \int_0^1 (d^3f)_{(1-s)t\eta+st\zeta}(t\eta-t\zeta,\eta,\zeta)ds + (d^2f)_{t\zeta}(\eta-\zeta,\zeta)\right\}dt.
\end{aligned}$$

Then we can conclude

$$\|N_{w_\chi}(\eta) - N_{w_\chi}(\zeta)\|_{L^p} \leq C(\|\eta\|_{L^p_1} + \|\eta\|_{L^p_1}\|\zeta\|_{L^p_1} + \|\zeta\|_{L^p_1})\|\eta-\zeta\|_{L^p_1},$$

where the constant C depends only on $\|\nabla w_\chi\|_{L^p}$ and c. The reason of the independence of C from $\|w_\chi\|_{L^\infty}$ is the compactness of the contact manifolds of the cylinders and boundedness of metrics and connections and so on. ∎

Let $\chi_i := (\overline{u}_i, \overline{v}_i, \rho_i)$, $i = 1, 2, \ldots$, be a sequence of $K \times K' \times [\rho_0, \infty)$ such that $\rho_i \to \infty$. We assume that $w_{\chi_i}((-\rho_i, \rho_i), [0,1])$ is contained in the Gaussian coordinate of q. For $\xi_i \in L^p_1(w^*_{\chi_i}TX, w^*_{\chi_i}TL_0, w^*_{\chi_i}TL_1)$, define $\xi_{0i} \in L^p_1([-\rho_i + \sqrt{\rho_i} - 1, \rho_i - \sqrt{\rho_i} + 1] \times [0,1]; T_qX, T_qL_0, T_qL_1)$ such that

$$D\exp_q(\xi_{0i}(\tau,t)) = \xi_i(\tau,t).$$

Note that, if we put $\beta_i(\tau) := \beta(-\tau + \rho_i - \sqrt{\rho_i} + 1)\beta(\tau + \rho_i - \sqrt{\rho_i} + 1)$, then $\beta_i\xi_{0i}$ is an element of $L^p_1(T_qX, T_qL_0, T_qL_1)$. Similarly define differential operators E_{0i} on $[-\rho_i + \sqrt{\rho_i} - 1, \rho_i - \sqrt{\rho_i} + 1] \times [0,1]$ by

$$D\exp_q(E_{0i}\xi_{0i}) = E_i\xi_i,$$

where E_i denotes the differential $Df_{w_{\chi_i}}(0)$. Note that the sequence of $\{E_{0i}\}_{i=1,2,\ldots}$ converges to the standard Cauchy-Riemann operator $\overline{\partial}_0$ on $[R_1, R_2] \times [0,1]$. (The convergence means that, if we denote $E_{0i} = a_i \frac{\partial}{\partial \tau} + b_i \frac{\partial}{\partial t} + c_i$, then $a_i \to 1$, $b_i \to J_0$ and $c_i \to 0$ in the C^∞ topology.)

Proposition 4.3 *If* $\|\xi_i\|_{L^p_1} = 1$ *and* $\|E_i \xi_i\|_{L^p} \to 0$, *then there exists a subsequence* $\{\xi_{i_l}\}$ *such that*

$$\|\xi_{i_l}\|_{[R_1,R_2];L^p_1} \to 0.$$

Proof. From the assumption $\|\xi_i\|_{L^p_1} = 1$, there is a constant C such that $\|\beta_i \xi_{0i}\|_{L^p_1} \leq C$. By the Rellich's theorem, there exists $\xi_{(R_1,R_2)} \in L^p([R_1,R_2]\times[0,1]; T_qX, T_qL_0, T_qL_1)$ and a subsequence $\{\beta_{i_l}\xi_{0i_l}\}$ such that

$$\|\xi_{(R_1,R_2)} - \beta_{i_l}\xi_{0i_l}\|_{[R_1,R_2];L^p} \to 0.$$

For simplicity, we use ξ_{0i} to denote $\beta_i\xi_{0i}$ and assume $\{\beta_i\xi_{0i}\}$ satisfies $\|\beta_i\xi_{0i} - \xi_{(R_1,R_2)}\|_{[R_1,R_2];L^p} \to 0$ and $\xi_{(R_1',R_2')}|_{[R_1,R_2]\times[0,1]} = \xi_{(R_1,R_2)}$ for $[R_1,R_2] \subset [R_1', R_2']$. By the Gärding's inequality

$$\|\xi_{0i} - \xi_{0j}\|_{[R_1,R_2];L^p_1} \leq C(\|E_{0i}(\xi_{0i} - \xi_{0j})\|_{[R_1+\delta,R_2+\delta];L^p} + \|\xi_{0i} - \xi_{0j}\|_{[R_1+\delta,R_2+\delta];L^p}),$$

where C is a constant depending on R_1, R_2 and δ. We already know $\|\xi_{0i} - \xi_{0j}\|_{[R_1+\delta,R_2+\delta];L^p} \to 0$, and from

$$\begin{aligned}
& \|E_{0i}(\xi_{0i} - \xi_{0j})\|_{[R_1+\delta,R_2+\delta];L^p} \\
\leq\ & \|E_{0i}\xi_{0i}\|_{[R_1+\delta,R_2+\delta];L^p} + \|(E_{0i} - E_{0j})\xi_{0j}\|_{[R_1+\delta,R_2+\delta];L^p} + \|E_{0j}\xi_{0j}\|_{[R_1+\delta,R_2+\delta];L^p} \\
\leq\ & \|E_{0i}\xi_{0i}\|_{[R_1+\delta,R_2+\delta];L^p} + \|E_{0i} - E_{0j}\|_{[R_1+\delta,R_2+\delta];L^p}\|\xi_{0j}\|_{[R_1+\delta,R_2+\delta];L^p_1} + \|E_{0j}\xi_{0j}\|_{[R_1+\delta,R_2+\delta];L^p} \\
\to\ & 0,
\end{aligned}$$

we can conclude $\|E_{0i}(\xi_{0i} - \xi_{0j})\|_{[R_1+\delta,R_2+\delta];L^p} \to 0$. Then $\{\xi_{0i}\}$ has a subsequence which converges to $\xi_{(R_1,R_2)}$ in the norm $\|\cdot\|_{[R_1,R_2];L^p_1}$. Moreover, from $\|\beta_i\xi_{0i}\|_{L^p_1} \leq C$, we can conclude $\|\xi_\infty\|_{L^p_1} \leq C$, where $\xi_\infty|_{[R_1,R_2]\times[0,1]} := \xi_{(R_1,R_2)}$. On the other hand, from

$$\begin{aligned}
& \|\overline{\partial}_0\xi_\infty\|_{[R_1,R_2];L^p} \\
\leq\ & \|E_{0i}\xi_{0i}\|_{[R_1,R_2];L^p} + \|(E_{0i} - \overline{\partial}_0)\xi_{0i}\|_{[R_1,R_2];L^p} + \|\overline{\partial}_0(\xi_{0i} - \xi_\infty)\|_{[R_1,R_2];L^p} \\
\leq\ & \|E_{0i}\xi_{0i}\|_{[R_1,R_2];L^p} + \|E_{0i} - \overline{\partial}_0\|_{[R_1,R_2];L^p}\|\xi_{0i}\|_{[R_1,R_2];L^p_1} + C\|\xi_{0i} - \xi_\infty\|_{[R_1,R_2];L^p_1} \\
\to\ & 0,
\end{aligned}$$

$\overline{\partial}\xi_\infty = 0$ and hence $\xi_\infty = 0$. Finally, from $\|\xi_i\|_{[R_1,R_2];L^p_1} \leq C\|\xi_{0i}\|_{[R_1,R_2];L^p_1}$, there exists a subsequence $\{\xi_{i_l}\}$ such that $\|\xi_{i_l}\|_{[R_1,R_2];L^p_1} \to 0$. ∎

For $\eta \in \mathrm{Ker}E_{\overline{u}}$ and $\zeta \in \mathrm{Ker}E_{\overline{v}}$, we define $\eta\sharp_\rho\zeta \in L^p_1(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$ by

$$(\eta\sharp_\rho\zeta)(\tau,t) := \begin{cases} \beta(-\tau-2)\eta(\tau+\rho_i), & \tau \leq 2, \\ 0, & -2 \leq \tau \leq 2, \\ \beta(\tau-2)\zeta(\tau-\rho_i), & 2 \leq \tau. \end{cases}$$

Let $W^\perp_{w_\chi}$ be the L^2-orthogonal compliment of $W_{w_\chi} := \{\eta\sharp_\rho\zeta | \eta \in \mathrm{Ker}E_{\overline{u}}, \zeta \in \mathrm{Ker}E_{\overline{v}}\}$ in $L^p_1(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$. (Note that the dimension of W_{w_χ} is equal to $\dim \mathrm{Ker}E_{\overline{u}} + \dim \mathrm{Ker}E_{\overline{v}}$.)

Proposition 4.4 *There exist constants* ρ_0 *and* C *such that for* $\chi \in K \times K' \times [\rho_0, \infty)$ *and* $\xi \in W^\perp_{w_\chi}$

$$\|\xi\|_{L^p_1} \leq C\|E_{w_\chi}\xi\|_{L^p}.$$

Proof. Let $\chi_i := (\overline{u}_i, \overline{v}_i, \rho_i)$, $i = 1, 2, \ldots$, be a sequence such that $\rho_i \to \infty$ and there exist $\xi_i \in W^\perp_{w_{\chi_i}}$ satisfying $\|\xi_i\|_{L^p_1} = 1$ and $\|E_{w_{\chi_i}}\xi_i\|_{L^p} \to 0$. Then we can conclude from Proposition 4.3 there exists a subsequence $\{\xi_{i_l}\}$ such that $\|\xi_{i_l}\|_{[-3,3];L^p_1} \to 0$. For simplicity we denote this subsequence by $\{\xi_i\}$ and define

$$\begin{aligned} \eta_i(\tau,t) &:= \beta(-\tau+\rho_i-1)\xi_i(\tau-\rho_i,t) \in L^p_1(\overline{u}^*_i TX, \overline{u}^*_i TL_0, \overline{u}^*_i TL_1), \\ \zeta_i(\tau,t) &:= \beta(\tau+\rho_i-1)\xi_i(\tau+\rho_i,t) \in L^p_1(\overline{v}^*_i TX, \overline{v}^*_i TL_0, \overline{v}^*_i TL_1). \end{aligned}$$

Split η_i into $k_i + n_i$, where $k_i \in \mathrm{Ker}E_{\overline{u}_i}$ and $n_i \in (\mathrm{Ker}E_{\overline{u}_i})^\perp$, then

$$\begin{aligned} \|\eta_i\|_{L^p_1} &\leq \|k_i\|_{L^p_1} + \|n_i\|_{L^p_1} \\ &\leq \|k_i\|_{L^p_1} + C_{\overline{u}_i}\|E_{\overline{u}_i}n_i\|_{L^p} \\ &\leq \|k_i\|_{L^p_1} + C_{\overline{u}_i}\|E_{\overline{u}_i}\eta_i\|_{L^p} \\ &= \|k_i\|_{L^p_1} + C_{\overline{u}_i}\|E_{w_{\chi_i}}\left(\beta(-\tau+\rho_i-1)\xi_i(\tau-\rho_i,t)\right)\|_{L^p} \\ &\leq \|k_i\|_{L^p_1} + C'_{\overline{u}_i}\|\xi_i\|_{[-2,-1];L^p_1} + C''_{\overline{u}_i}\|E_{w_{\chi_i}}\xi_i\|_{L^p} \end{aligned}$$

(Note that, from the compactness of K, $C'_{\overline{u}_i}$ and $C''_{\overline{u}_i}$ are bounded.) We already know $\|\xi_i\|_{[-2,-1];L^p_1} \to 0$ and $\|E_{w_{\chi_i}}\xi_i\|_{L^p} \to 0$. Let $\{e^i_1, \ldots, e^i_r\}$ be orthogonal bases of $\mathrm{Ker} E_{\overline{u}_i}$.

$$\begin{array}{rcl} |\langle k_i, e^i_j \rangle| & = & |\langle \eta_i, e^i_j \rangle| \\ & = & |\langle \eta_i, (1-\beta(-\tau-\rho_i+2))e^i_j \rangle|_{[\rho_i-2,\rho_i-1]\times[0,1]}| \\ & \leq & \|\eta_i\|_{[\rho_i-2,\rho_i-1];L^p}\|e^i_j\|_{[\rho_i-2,\rho_-1];L^{p/(p-1)}} \\ & \leq & C\|\xi_i\|_{[-2,-1];L^p}\|e^i_j\|_{[\rho_i-2,\rho_i-1];L^{p/(p-1)}}. \end{array}$$

Hence, from $\|k_i\|_{L^p_1} \leq \sum_j |\langle k_i, e^i_j \rangle| \|e^i_j\|_{L^p_1}$, we conclude $\|k_i\|_{L^p_1} \to 0$. (Note that the compactness of K induces the boundedness of norms of e^i_j.) Then we obtain $\|\eta_i\|_{L^p_1} \to 0$. Similarly we can prove also $\|\zeta_i\|_{L^p_1} \to 0$. Put together them with

$$\|\xi_i\|_{L^p_1} \leq \|\eta_i\|_{L^p_1} + \|\xi_i\|_{[-3,3];L^p_1} + \|\zeta_i\|_{L^p_1},$$

we obtain $\|\xi_i\|_{L^p_1} \to 0$ which is a contradiction to the assumption $\|\xi_i\|_{L^p_1} = 1$. We finish proving the proposition. ∎

Proposition 4.5 *There exist constants* ρ_0 *and* C *such that for* $\chi \in K \times K' \times [\rho_0, \infty)$ *there exists a map* $G_{w_\chi} : L^p(w^*_\chi TX) \to W^\perp_{w_\chi} \subset L^p_1(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$ *such that*

$$\begin{array}{rcl} E_{w_\chi} G_{w_\chi} & = & \mathrm{id}, \\ \|G_{w_\chi}\xi\|_{L^p_1} & \leq & C\|\xi\|_{L^p}. \end{array} \tag{7}$$

Proof. From Proposition 4.4, if $\xi \in \mathrm{Ker} E_{w_\chi} \cap W^\perp_{w_\chi}$, then $\xi = 0$ and

$$\dim \mathrm{Ker} E_{w_\chi} \leq \dim \mathrm{Ker} E_{\overline{u}} + \dim \mathrm{Ker} E_{\overline{v}}.$$

On the other hand, from Assumption 3.1,

$$\begin{array}{rcl} \dim \mathrm{Ker} E_{w_\chi} & \geq & \mathrm{Ind} E_{w_\chi} \\ & = & \mathrm{Ind} E_{\overline{u}} + \mathrm{Ind} E_{\overline{v}} \\ & = & \dim \mathrm{Ker} E_{\overline{u}} + \dim \mathrm{Ker} E_{\overline{v}}. \end{array}$$

Hence we obtain

$$\mathrm{Ker} E_{w_\chi} \oplus W^\perp_{w_\chi} = L^p_1(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1),$$

and E_{w_χ} is surjective. From the estimate of Proposition 4.4 we can obtain G_{w_χ} as in the proposition. ∎

So far we obtain the following: Let $K \subset \mathcal{M}^1_I(p_-, q)$ and $K' \subset \mathcal{M}^1_I(q, p_+)$ be compact sets. Then there are constants ρ_0 such that, for $\chi := (\overline{u}, \overline{v}, \rho) \in K \times K' \times [\rho_0, \infty)$, a map $f_{w_\chi} : L^p_1(w_\chi^* TX, w_\chi^* TL_0, w_\chi^* TL_1) \to L^p(w_\chi^* TX)$ satisfies (5) and (6) and $Df_{w_\chi}(0)$ possesses a right inverse $G_{w_\chi} : L^p(w_\chi^* TX) \to L^p_1(w_\chi^* TX, w_\chi^* TL_0, w_\chi^* TL_1)$ satisfying (7). Then, from the Newton's method in Appendix A, we can conclude that there are constants ρ_0 and C and a smooth map

$$\sharp : K \times K' \times [\rho_0, \infty) \to \mathcal{M}^2_I(p_-, p_+), \ \chi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L^p_1} \leq C \|\overline{\partial}_{J_t} w_\chi\|_{L^p}$. Divide them by the $\mathbf{R}$ actions, and we obtain a gluing map $\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_I(p_-, p_+)$.

The next step is to show the surjectivity of $\sharp : K \times K' \times [\rho_0, \infty) \to \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon, \rho)}(\overline{u}, \overline{v})$. Let w be a map which satisfies the Lagrangian boundary conditions and (**I**) and the decay conditions (**1**) and (**1**$'$), and $w(\tau, t) = \exp_q \eta(\tau, t)$ for $-1 \leq \tau \leq 1$, where $q \in L_0 \cap L_1$. Then we define

$$x_\rho(\tau, t) := \begin{cases} w(\tau - \rho, t), & \tau \leq \rho - 1, \\ \exp_q \beta(-\tau + \rho) \eta(\tau - \rho, t), & \rho - 1 \leq \tau, \end{cases}$$

$$y_\rho(\tau, t) := \begin{cases} \exp_q \beta(\tau + \rho) \eta(\tau + \rho, t), & \tau \leq -\rho + 1, \\ w(\tau + \rho, t), & -\rho + 1 \leq \tau. \end{cases}$$

Moreover we define $U_{(\varepsilon, \rho_0)}(\overline{u}, \overline{v})$, for $(\overline{u}, \overline{v}) \in K \times K'$, to be the set of w such that, for $\rho > \rho_0$, $\|\overline{u} - x_\rho\|_{L^p_1} < \varepsilon$ and $\|\overline{v} - y_\rho\|_{L^p_1} < \varepsilon$. (For simplicity, we shall use a letter x to denote x_ρ, and also $y := y_\rho$.) If $w \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon, \rho_0)}(\overline{u}, \overline{v})$, then for a smooth map f_x there are constants C and C' such that

$$\begin{aligned} \|f_x(0)\|_{L^p} &\leq C \|\eta\|_{[-1,0]; L^p_1}, & (8) \\ \|N_x(\xi) - N_x(\xi')\|_{L^p} &\leq C'(\|\xi\|_{L^p_1} + \|\xi'\|_{L^p_1}) \|\xi - \xi'\|_{L^p_1}, & (9) \end{aligned}$$

where $\|\xi\|_{L^p_1} \leq c$ and $\|\xi'\|_{L^p_1} \leq c$ and C' depends on c, and also for f_y. (The proofs of the above estimates are similar to those of (5) and (6).)

For $\xi \in \mathrm{Ker}E_w$, we define $\hat{\xi} := (\xi_x, \xi_y) \in L^p_1(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_1(y^*TX, y^*TL_0, y^*TL_1)$ by

$$\begin{aligned}\xi_x &:= \beta(-\tau+\rho+1)\xi(\tau-\rho, t),\\ \xi_y &:= \beta(\tau+\rho+1)\xi(\tau+\rho, t).\end{aligned}$$

Let $W^{\perp}_{(w,\rho)}$ the L^2-orthogonal compliment of $W_{(w,\rho)} := \{\hat{\xi} | \xi \in \mathrm{Ker}E_w\}$ in $L^p_1(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_1(y^*TX, y^*TL_0, y^*TL_1)$.

Proposition 4.6 *There are constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $w \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ and $\xi := (\xi_x, \xi_y) \in W^{\perp}_{(w,\rho)}$*

$$\|\xi\|_{L^p_1} \leq C\|(E_x\xi_x, E_y\xi_y)\|_{L^p}.$$

Proof. Let $\{\varepsilon_i\}_{i=1,2,\ldots}$ and $\{\rho_i\}_{i=1,2,\ldots}$ and $w_i \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon_i,\rho_i)}(\overline{u}, \overline{v})$ be sequences such that $\varepsilon_i \to 0$ and $\rho_i \to \infty$ and there exist $\xi_i = (\xi_{x_i}, \xi_{y_i}) \in W^{\perp}_{(w_i,\rho_i)}$ satisfying $\|\xi_i\|_{L^p_1} = 1$ and $\|(E_{x_i}\xi_{x_i}, E_{y_i}\xi_{y_i})\|_{L^p} \to 0$. Then, in a similar way to the proof of Proposition 4.4, we can prove that there exists a subsequence $\{\xi_{i_l}\}$ such that $\|\xi_{i_l}\|_{L^p_1} \to 0$, which contradicts the assumption $\|\xi_i\|_{L^p_1} = 1$. ∎

Proposition 4.7 *There exist constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $w \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ there exists a map $G_{(w,\rho)} : L^p(x^*TX) \oplus L^p(y^*TX) \to W^{\perp}_{(w,\rho)}$ such that*

$$\begin{aligned}(E_x \oplus E_y)G_{(w,\rho)} &= \mathrm{id},\\ \|G_{(w,\rho)}\xi\|_{L^p_1} &\leq C\|\xi\|_{L^p}.\end{aligned} \tag{10}$$

Proof. From Proposition 4.6, if $\xi \in \mathrm{Ker}(E_x \oplus E_y) \cap W^{\perp}_{(w,\rho)}$, then $\xi = 0$ and

$$\dim \mathrm{Ker}(E_x \oplus E_y) \leq \dim W_{(w,\rho)}.$$

On the other hand, from Assumption 3.1,

$$\begin{aligned}\dim \mathrm{Ker}(E_x \oplus E_y) &\geq \mathrm{Ind}E_x + \mathrm{Ind}E_y\\ &= \dim W_{(w,\rho)}.\end{aligned}$$

Hence we obtain

$$\mathrm{Ker}(E_x \oplus E_y) \oplus W^{\perp}_{(w,\rho)} = L^p_1(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_1(y^*TX, y^*TL_0, y^*TL_1),$$

and $E_x \oplus E_y$ is surjective. From the estimate of Proposition 4.6 we can obtain $G_{(w,\rho)}$ as in the proposition. ∎

So far we obtain the following: There are constants $\varepsilon_0 > 0$ and ρ_0 such that, for $w \in \mathcal{M}_I^2(p_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$, a map $f_{(x,y)} := (f_x, f_y) : L_1^p(x^*TX, x^*TL_0, x^*TL_1) \oplus L_1^p(y^*TX, y^*TL_0, y^*TL_1) \to L^p(x^*TX) \oplus L^p(y^*TX)$ satisfies (8) and (9), and $Df_{(x,y)}(0)$ possesses a right inverse $G_{(w,\rho)} : L^p(x^*TX) \oplus L^p(y^*TX) \to L_1^p(x^*TX, x^*TL_0, x^*TL_1) \oplus L_1^p(y^*TX, y^*TL_0, y^*TL_1)$ satisfying (10). Then, from the Newton's method in Appendix A, we can conclude that there are constants $\varepsilon > 0$ and ρ and C and a smooth map

$$\sharp' : \mathcal{M}_I^2(p_-, p_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to K \times K', \ w \mapsto (\exp_x(\xi_{w;x}), \exp_y(\xi_{w;y}))$$

with $\|\xi_{w;x}\|_{L_1^p} \leq C\|\overline{\partial}_{J_t} x\|_{L^p}$ and $\|\xi_{w;y}\|_{L_1^p} \leq C\|\overline{\partial}_{J_t} y\|_{L^p}$. Divide them by the $\mathbf{R}$ actions, and we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}_I^1(p_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to \hat{K} \times \hat{K}'$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**i**).

Next we will prove the gluing argument (**ii**). Take a lift of $\hat{\mathcal{M}}_{II'}^0(p_-, \gamma_-) \times \hat{\mathcal{M}}_{IV}^0(\gamma_-, \gamma_+) \times \hat{\mathcal{M}}_{II}^0(\gamma_+, p_+)$ in $\mathcal{M}_{II'}^1(p_-, \gamma_-) \times \mathcal{M}_{IV}^2(\gamma_-, \gamma_+) \times \mathcal{M}_{II}^1(\gamma_+, p_+)$ and consider the orbit of the lift by the following $\mathbf{R}^2$-action: for $(a, 0) \in \mathbf{R}^2$

$$(a, 0) \cdot (\overline{u}, \overline{w}, \overline{v}) := (\overline{u}, a * \overline{w}, \overline{u}) \,,$$

and for $(0, b) \in \mathbf{R}^2$

$$(0, b) \cdot (\overline{u}, \overline{w}, \overline{v}) := (\overline{u}, b\sharp\overline{w}, \overline{u}) \,.$$

Note that the orbit is diffeomorphic to $\hat{\mathcal{M}}_{II'}^0(p_-, \gamma_-) \times \hat{\mathcal{M}}_{IV}^0(\gamma_-, \gamma_+) \times \hat{\mathcal{M}}_{II}^0(\gamma_+, p_+) \times \mathbf{R}^2$. We choose a compact set S in the orbit, and we will construct a gluing map $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}_I^2(p_-, p_+)$. We consider a concave end which is isomorphic to $(-\infty, R] \times M$. Fix $(\overline{u}, \overline{w}, \overline{v}) \in S$. For simplicity, for $\overline{u}$ we assume $c_+ = 0$ and $\tau_+ = \tau_0$, where c_+ and τ_0 are constants as in the decay condition ($\mathbf{2'}$), and we denote (α, θ_+, z_+) as in ($\mathbf{2'}$) by $(\alpha_u, \theta_+^u, z_+^u)$. Also for $\overline{v}$ we assume $c_- = 0$ and $\tau_- = \tau_0$, as in (**2**), and we denote (α, θ_-, z_-) as in (**2**) by $(\alpha_v, \theta_-^v, z_-^v)$. Moreover, for $\overline{w}$

we assume $c_+ = c_- = 0$ and $\tau_+ = -\tau_- = \tau_0$, and we denote (α, θ_-, z_-) by $(\alpha_w, \theta_-^w, z_-^w)$ and (α, θ_+, z_+) by $(\alpha_w, \theta_+^w, z_+^w)$. We define $w_\chi(\tau, t) \in L_1^p(\mathbf{R} \times [0,1]; X, L_0, L_1)$ for $\chi := (\overline{u}, \overline{w}, \overline{v}, \rho) \in S \times [\rho_0, \infty)$ by $w_\chi(\tau, t) :=$

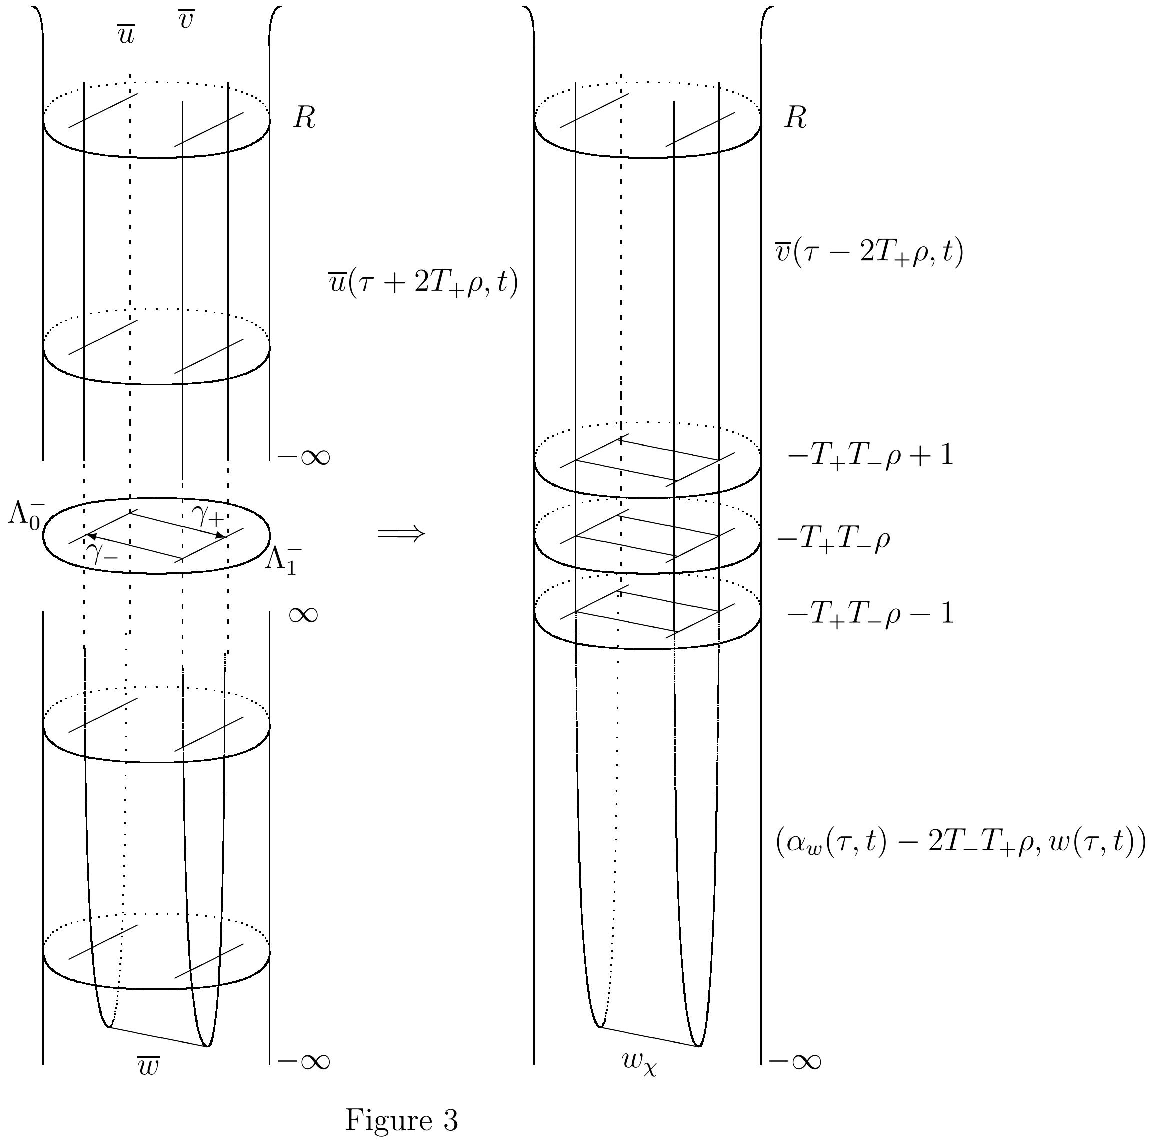

Figure 3

- $\overline{u}(\tau + 2T_+\rho, t)$, for $\tau \le -T_+\rho - 1/T_-$,
- $(\beta(-T_-\tau - T_-T_+\rho)\alpha_u(\tau+2T_+\rho,t) + \{1-\beta(-T_-\tau - T_-T_+\rho)\}(-T_-\tau - 2T_-T_+\rho), \beta(-T_-\tau - T_-T_+\rho)\theta^u_+(\tau+2T_+\rho, 1-t) + \{1-\beta(-T_-\tau - T_-T_+\rho)\}(1-t), \beta(-T_-\tau - T_-T_+\rho) z^u_+(\tau + 2T_+\rho, t))$, for $-T_+\rho - 1/T_- \le \tau \le -T_+\rho$,
- $(\beta(T_-\tau+T_-T_+\rho)(\alpha_w(\tau,t) - 2T_-T_+\rho) + \{1-\beta(T_-\tau+T_-T_+\rho)\}(-T_-\tau - 2T_-T_+\rho), \beta(T_-\tau+T_-T_+\rho)\theta^w_-(\tau,1-t) + \{1-\beta(T_-\tau+T_-T_+\rho)\}(1-t), \beta(T_-\tau+T_-T_+\rho) z^w_-(\tau,t))$, for $-T_+\rho \le \tau \le -T_+\rho + 1/T_-$,
- $(\alpha_w(\tau,t) - 2T_-T_+\rho, w(\tau,t))$, for $-T_+\rho + 1/T_- \le \tau \le T_-\rho - 1/T_+$,
- $(\beta(-T_+\tau+T_-T_+\rho)(\alpha_w(\tau,t) - 2T_-T_+\rho) + \{1-\beta(-T_+\tau+T_-T_+\rho)\}(T_+\tau - 2T_-T_+\rho), \beta(-T_+\tau+T_-T_+\rho)\theta^w_+(\tau,t) + \{1-\beta(-T_+\tau+T_-T_+\rho)\}t, \beta(-T_+\tau + T_-T_+\rho) z^w_+(\tau,t))$, for $T_-\rho - 1/T_+ \le \tau \le T_-\rho$,
- $(\beta(T_+\tau - T_-T_+\rho)\alpha_v(\tau - 2T_-\rho, t) + \{1-\beta(T_+\tau - T_-T_+\rho)\}(T_+\tau - 2T_-T_+\rho), \beta(T_+\tau - T_-T_+\rho)\theta^v_-(\tau - 2T_-\rho, t) + \{1-\beta(T_+\tau-T_-T_+\rho)\}t, \beta(T_+\tau - T_-T_+\rho) z^v_-(\tau - 2T_-\rho, t))$, for $T_-\rho \le \tau \le T_-\rho + 1/T_+$,
- $\overline{v}(\tau - 2T_-\rho, t)$ for $T_-\rho + 1/T_+ \le \tau$,

see Figure 3. Then $\overline{\partial}_{J_t} w_\chi = 0$ for $\tau \le -T_+\rho - 1/T_-$, $-T_+\rho + 1/T_- \le \tau \le T_-\rho - 1/T_+$ and $T_-\rho + 1/T_+ \le \tau$, and there are constants $C_1 > 0$ and $d > 0$ such that

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p} \le C_1 e^{-d\rho}, \tag{11}$$

where C_1 depends only on S and ρ_0, and N_{w_χ} satisfies

$$\|N_{w_\chi}(\xi) - N_{w_\chi}(\xi')\|_{L^p} \le C_2(\|\xi\|_{L^p_1} + \|\xi'\|_{L^p_1})\|\xi - \xi'\|_{L^p_1}, \tag{12}$$

where $\|\xi\|_{L^p_1} \le c$ and $\|\xi'\|_{L^p_1} \le c$ and C_2 is a constant depending only on $\|\nabla w_\chi\|_{L^p}$ and c. (The proof is similar to that of (6).)

From a spectral flow we can conclude

$$\mathrm{Ind} E_{w_\chi} = \mathrm{Ind} E_{\overline{u};\sigma} + \dim \mathrm{Ker} Q_\infty + \mathrm{Ind} E_{\overline{w};\sigma} + \dim \mathrm{Ker} Q'_\infty + \mathrm{Ind} E_{\overline{v};\sigma},$$

where $E_{\overline{u}} = \frac{\partial}{\partial \tau} - Q_\tau$ and $E_{\overline{v}} = \frac{\partial}{\partial \tau} - Q'_\tau$. In Section 2 we know $\dim \mathrm{Ker} Q_\infty = \dim \mathrm{Ker} Q'_\infty = 1$, then $\mathrm{Ind} E_{w_\chi} = \mathrm{Ind} E_{\overline{u};\sigma} + \mathrm{Ind} E_{\overline{w};\sigma} + \mathrm{Ind} E_{\overline{v};\sigma} + 2$. For simplicity, in the following, we assume that $\mathrm{Ind} E_{\overline{u};\sigma} = \mathrm{Ind} E_{\overline{w};\sigma} = \mathrm{Ind} E_{\overline{v};\sigma} = 0$ (and hence $\mathrm{Ind} E_{w_\chi} = 2$). We will introduce the following two sections e^0_ρ and e^1_ρ of $w^*_\chi TX$:

- Note that $\frac{d}{da}(a * \overline{u})|_{a=0}$ is a section of $\overline{u}^*TX$ which, as $\tau \to \infty$, is close to $T_-(\frac{\partial}{\partial\alpha})$, and $\frac{d}{da}(a * \overline{w})|_{a=0} - T_+\frac{d}{db}(b\sharp\overline{w})|_{b=0}$ is a section of $\overline{w}^*TX$ which, as $\tau \to -\infty$, is close to $(T_- + T_+)(\frac{\partial}{\partial\alpha})$ and, as $\tau \to \infty$, is close to 0. In a similar way to construct w_χ, we glue $\beta(\tau - \tau_0 + 1)\frac{d}{da}(a * \overline{u})|_{a=0}$ and $\frac{1}{T_- + T_+}\{\frac{d}{da}(a * \overline{w})|_{a=0} - T_+\frac{d}{db}(b\sharp\overline{w})|_{b=0}\}$ and the zero-section of $\overline{v}^*TX$ to construct e^0_ρ. Then $E_{w_\chi}e^0_\rho = 0$ for $\tau \leq -2T_+\rho + \tau_0 - 1$ $-2T_+\rho + \tau_0 \leq \tau \leq -T_+\rho - 1/T_-$, $-T_+\rho + 1/T_- \leq \tau \leq T_-\rho - 1/T_+$ and $T_-\rho + 1/T_+ \leq \tau$.

- Note that $\frac{d}{da}(a * \overline{w})|_{a=0} + T_-\frac{d}{db}(b\sharp\overline{w})|_{b=0}$ is a section of $\overline{w}^*TX$ which, as $\tau \to -\infty$, is close to 0 and, as $\tau \to \infty$, is closed $-(T_- + T_+)(\frac{\partial}{\partial\alpha})$. In a similar way to construct w_χ, we glue the zero-section of $\overline{u}^*TX$ and $-\frac{1}{T_- + T_+}\{\frac{d}{da}(a * \overline{w})|_{a=0} + T_-\frac{d}{db}(b\sharp\overline{w})|_{b=0}\}$ and $\beta(-\tau - \tau_0 + 1)\frac{d}{da}(a * \overline{v})|_{a=0}$ to construct e^1_ρ. Then $E_{w_\chi}e^1_\rho = 0$ for $\tau \leq -T_+\rho - 1/T_-$, $-T_+\rho + 1/T_- \leq \tau \leq T_-\rho - 1/T_+$, $T_-\rho + 1/T_+ \leq \tau \leq 2T_-\rho - \tau_0$ and $2T_-\rho - \tau_0 + 1 \leq \tau$.

From the construction, we can conclude that e^0_ρ is close to $(\frac{\partial}{\partial\alpha})$ on $H_- := [\tau_0 - 2T_+\rho, -\tau_0]$ and 0 on $H_+ := [\tau_0, -\tau_0 + 2T_-\rho]$, and e^1_ρ is close to 0 on H_- and $(\frac{\partial}{\partial\alpha})$ on H_-. Hence

$$\lim_{\rho\to\infty} \frac{\|e^0_\rho\|_{H;L^2}}{\|e^0_\rho\|_{L^2}} = 1, \ \lim_{\rho\to\infty} \frac{\|e^1_\rho\|_{H;L^2}}{\|e^1_\rho\|_{L^2}} = 1,$$
$$\lim_{\rho\to\infty} \int_{\mathbf{R}\times[0,1]} \left(e^0_\rho/\|e^0_\rho\|_{L^2}, e^1_\rho/\|e^1_\rho\|_{L^2}\right) d\tau dt = 0.$$

Proposition 4.8 *Let* $\chi_i := (\overline{u}_i, \overline{w}_i, \overline{v}_i, \rho_i)$, $i = 1, 2, \ldots$, *be a sequence of* $S \times [\rho_0, \infty)$ *such that* $\rho_i \to \infty$. *If* $\|\xi_i\|_{L^p_1} = 1$ *and* $\|E_{w_{\chi_i}}\xi_i\|_{L^p} \to 0$, *then there exists a subsequence* $\{\xi_{i_l}\}$ *such that*

$$\|\xi_{i_l}\|_{[-T_+\rho+R_1, -T_+\rho+R_2];L^p_1} \to 0,$$

where $R_1 \leq 0 \leq R_2$.

Proof. The proof is similar to that of Proposition 4.3. Define $\xi'_i(\tau, t) := \xi_i(\tau - T_+\rho, t)$. By Rellich's theorem, there exists $\xi'_{(R_1,R_2)} \in L^p([R_1, R_2] \times [0,1]; E \oplus \gamma_-^*\xi, \mathbf{R}(\frac{\partial}{\partial\alpha}) \oplus T_{\gamma_-(0)}\Lambda_0^-, \mathbf{R}(\frac{\partial}{\partial\alpha}) \oplus T_{\gamma_-(1)}\Lambda_1^-)$ and a subsequence

$\{\xi'_{i_l}\}$ which converges $\xi'_{(R_1,R_2)}$ in the norm $\|\cdot\|_{[R_1,R_2];L^p}$. For simplicity, we assume $\|\xi'_{(R_1,R_2)} - \xi'_i\|_{L^p} \to 0$ and $\xi'_{(R'_1,R'_2)}|_{[R_1,R_2]\times[0,1]} = \xi'_{(R_1,R_2)}$ for $[R_1, R_2] \subset [R'_1, R'_2]$. By the Gärding's inequality, we can conclude that $\{\xi'_i\}$ has a subsequence which converges to $\xi'_{(R_1,R_2)}$ in the norm $\|\cdot\|_{[R_1,R_2];L^p_1}$. Moreover, from $\|\xi'_i\|_{L^p_1} \le C$, we can conclude $\|\xi'_\infty\|_{L^p_1} \le C$, where $\xi'_\infty|_{[R_1,R_2]\times[0,1]} := \xi'_{(R_1,R_2)}$. On the other hand, ξ'_∞ splits into E component $(\xi'_\infty)_E$ and ξ component $(\xi'_\infty)_\xi$, and

$$\begin{aligned} \frac{\partial}{\partial\tau}(\xi'_\infty)_E + \sqrt{-1}\frac{\partial}{\partial t}(\xi'_\infty)_E &= 0, \\ \frac{\partial}{\partial\tau}(\xi'_\infty)_\xi + J_0\frac{\partial}{\partial t}(\xi'_\infty)_\xi - J_0\frac{\partial A}{\partial t}A^{-1}(\xi'_\infty)_\xi &= 0, \end{aligned}$$

where $-J_0\frac{\partial A}{\partial t}A^{-1}$ is the symmetric. Hence $\xi'_\infty = 0$ (see [18]), and then $\|\xi'_{i_l}\|_{[R_1,R_2];L^p_1} \to 0$. ∎

Let $W^\perp_{w_\chi}$ be the L^2-orthogonal compliment of $W_{w_\chi} := \langle e^0_\rho, e^1_\rho\rangle$ in $L^p_1(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$.

Proposition 4.9 *There exist constants* ρ_0 *and* C_3 *such that for* $\chi \in S \times [\rho_0, \infty)$ *and* $\xi \in W^\perp_{w_\chi}$

$$\|\xi\|_{L^p_1} \le C_3\rho^{\frac{3}{2}-\frac{1}{p}}\|E_{w_\chi}\xi\|_{L^p}.$$

Proof. Let $\chi_i := (\overline{u}_i, \overline{w}_i, \overline{v}_i, \rho_i), i = 1, 2, \ldots$, be a sequence such that $\rho_i \to \infty$ and there exist $\xi_i \in W^\perp_{w_\chi}$ satisfying $\|\xi_i\|_{L^p_1} = 1$ and $\rho_i^{\frac{3}{2}-\frac{1}{p}}\|E_{w_{\chi_i}}\xi_i\|_{L^p} \to 0$. We define the following smooth functions:

- $\beta_i(\tau) := \beta(-T_-\tau + T_+T_-\rho_i)$,
- $\beta'_i(\tau) := \beta(T_-\tau + T_+T_-\rho)$,
- $\beta''_i(\tau) := \beta(-T_+\tau - T_+T_-\rho)$,
- $\beta'''_i(\tau) := \beta(T_+\tau - T_+T_-\rho)$.

Then

$$\begin{aligned} \|\xi_i\|_{L^p_1} \le\ & \|\beta_i\xi_i\|_{L^p_1} + \|\xi_i\|_{[-T+\rho-1/T_-,-T_+\rho+1/T_-];L^p_1} + \|\beta'_i\beta''_i\xi_i\|_{L^p_1} \\ & + \|\xi_i\|_{[T_-\rho-1/T_+,T_-\rho+1/T_+];L^p_1} + \|\beta'''\xi_i\|_{L^p_1}. \end{aligned}$$

From Proposition 4.8, we can conclude $\|\xi_i\|_{[-T+\rho-1/T_-,-T_+\rho+1/T_-];L_1^p} \to 0$ and $\|\xi_i\|_{[-T+\rho-1/T_-,-T_+\rho+1/T_-];L_1^p} \to 0$. Since we assume $\mathrm{Ker} E_{\overline{u};\sigma} = 0$, there exist constants C such that $\|\beta_i\xi_i\|_{L_1^p} \leq C\|E_{\overline{u};\sigma}(\beta_i\xi_i)\|_{L^p}$, and then

$$\begin{aligned}
\|\beta_i\xi_i\|_{L_1^p} &\leq C\|E_{\overline{u};\sigma}(\beta_i\xi_i)\|_{L^p}\\
&\leq C\|E_{\overline{u}}(\beta_i\xi_i) - \frac{d\sigma}{d\tau}\pi_E(\beta_i\xi_i)\|_{L^p}\\
&= C\|E_{w_{\chi_i}}(\beta_i\xi_i) - \frac{d\sigma}{d\tau}\pi_E(\beta_i\xi_i)\|_{L^p}\\
&\leq C\|\beta_i E_{w_{\chi_i}}\xi_i\|_{L^p} + C\|\dot{\beta}_i\xi_i\|_{L^p} + C'\|\pi_E\xi_i\|_{[\tau_0-2T+\rho,-\tau_0];L^p}
\end{aligned}$$

From the assumption $\rho^{\frac{3}{2}-\frac{1}{p}}\|E_{w_{\chi_i}}\xi_i\|_{L^p} \to 0$ we know $\|\beta_i E_{w_{\chi_i}}\xi_i\|_{L^p} \to 0$, and from Proposition 4.8 we conclude $\|\dot{\beta}_i\xi_i\|_{L^p} \to 0$. Regard $\pi_E\xi_i$ on $[\tau_0-2T_+\rho,-\tau_0]\times[0,1]$ as a function on $T_i := \mathbf{R}/2(T_+\rho-\tau_0)\times[0,1]$, and split $\pi_E\xi_i$ into $n_i \in \mathrm{Ker}E_{w_{\chi_i}}$ and $k_i \in (\mathrm{Ker}E_{w_{\chi_i}})^{\perp}$. Since $\xi_i \in W_{w_{\chi_i}}^{\perp}$, we obtain $\lim_{i\to 0}\langle\pi_E\xi_i, e_{\rho_i}^0/\|e_{\rho_i}^0\|_{L^2}\rangle = 0$, and then $\lim_{i\to\infty}\|n_i\|_{L^2(T_i)} = 0$. Moreover, since $E_{w_{\chi_i}}|_E = \frac{\partial}{\partial\tau} + \sqrt{-1}\frac{\partial}{\partial t}$, then $\|k_i\|_{L^2(T_i)} \leq \frac{T_+\rho_i-\tau_0}{\pi}\|E_{w_{\chi_i}}k_i\|_{L^2(T_i)}$. By the Hölder's inequality $\|y\|_{L^2(T_i)} \leq (2T_+\rho_i - 2\tau_0)^{\frac{1}{2}-\frac{1}{p}}\|y\|_{L^p(T_i)}$ (we need $p > 2$) and the assumption $\rho_i^{\frac{3}{2}-\frac{1}{p}}\|E_{w_{\chi_i}}\xi_i\|_{L^p} \to 0$, we can conclude $\lim_{i\to\infty}\|k_i\|_{L^2(T_i)} = 0$, and then $\lim_{i\to\infty}\|\pi_E\xi_i\|_{L^2(T_i)} = 0$. From the assumption $\|\xi_i\|_{L_1^p} = 1$ and the Sobolev's embedding theorem (we need $p > 2$), we can conclude $|\xi_i| < c$. Then $\|\pi_E\xi_i\|_{L^p(T_i)} \leq c^{1-2/p}\|\pi_E\xi_i\|_{L^2(T_i)}^{2/p}$ (also we need $p > 2$), and $\lim_{i\to\infty}\|\pi_E\xi_i\|_{L^p(T_i)} = 0$. Finally, we finish proving $\lim_{i\to\infty}\|\beta_i\xi_i\|_{L_1^p} = 0$. Similarly, we can prove $\lim_{i\to\infty}\|\beta_i'\beta_i''\xi_i\|_{L_1^p} = 0$ and $\lim_{i\to\infty}\|\beta_i'''\xi_i\|_{L_1^p} = 0$, and then $\|\xi_i\|_{L_1^p} \to 0$ which is a contradiction to the assumption $\|\xi_i\|_{L_1^p} = 1$. ∎

Proposition 4.10 *There exist constants* ρ_0 *and* C_3 *such that for* $\chi \in S\times[\rho_0,\infty)$ *there exists a map* $G_{w_\chi} : L^p(w_\chi TX) \to W_{w_\chi}^{\perp}$ *such that*

$$\begin{aligned}
E_{w_\chi}G_{w_\chi} &= \mathrm{id},\\
\|G_{w_\chi}\xi\|_{L_1^p} &\leq C_3\rho^{\frac{3}{2}-\frac{1}{p}}\|\xi\|_{L^p}.
\end{aligned} \tag{13}$$

Proof. From Proposition 4.9, if $\xi \in \mathrm{Ker}E_{w_\chi} \cap W_{w_\chi}^{\perp}$, then $\xi = 0$ and

$$\dim \mathrm{Ker}E_{w_\chi} \leq 2.$$

On the other hand, from Assumption 3.1,

$$\begin{aligned}\dim \mathrm{Ker} E_{w_\chi} &\geq \mathrm{Ind} E_{w_\chi} \\ &= 2.\end{aligned}$$

Hence we obtain

$$\mathrm{Ker} E_{w_\chi} \oplus W_{w_\chi}^{\perp} = L_1^p(w_\chi^* TX, w_\chi^* TL_0, w_\chi^* TL_1),$$

and E_{w_χ} is surjective. From the estimate of Proposition 4.9 we can obtain G_{w_χ} as in the proposition. ∎

So far we obtain the following: Let S be a compact set in the orbit. Then there are constants ρ_0 such that, for $\chi := (\overline{u}, \overline{w}, \overline{v}, \rho) \in S \times [\rho_0, \infty)$, a map $f_{w_\chi} : L_1^p(w_\chi^* TX, w_\chi^* TL_0, w_\chi^* TL_1) \to L^p(w_\chi^* TX)$ satisfies (11) and (12) and $Df_{w_\chi}(0)$ possesses a right inverse $G_{w_\chi} : L^p(w_\chi^* TX) \to L_1^p(w_\chi^* TX, w_\chi^* TL_0, w_\chi^* TL_1)$ satisfying (13). From (11) and (13)

$$\|G_{w_\chi} f_{w_\chi}(0)\|_{L_1^p} \leq C_1 C_2 \rho^{\frac{3}{2} - \frac{1}{p}} e^{-d\rho},$$

and from (12) and (13)

$$\|G_{w_\chi} N_{w_\chi}(\xi) - G_{w_\chi} N_{w_\chi}(\xi')\|_{L_1^p} \leq C_2 C_3 \rho^{\frac{3}{2} - \frac{1}{p}} (\|\xi\|_{L_1^p} + \|\xi'\|_{L_1^p}) \|\xi - \xi'\|_{L_1^p}.$$

Denote $C := C_2 C_3 \rho^{\frac{3}{2} - \frac{1}{p}}$ and choose ρ_0 large enough, then

$$\|G_{w_\chi} f_{w_\chi}(0)\|_{L_1^p} \leq \frac{1}{8C}.$$

Then, from the Newton's method in Appendix A, we can conclude that there are constants ρ_0 and C' and a smooth map

$$\sharp : S \times [\rho_0, \infty) \to \mathcal{M}_I^2(p_-, p_+), \ \chi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L_1^p} \leq C' \|\overline{\partial}_{J_t} w_\chi\|_{L^p}$. Divide them by the $\mathbf{R}$ actions, then we obtain a gluing map $\hat{\sharp} : \hat{S} \times [\rho_0, \infty) \to \hat{\mathcal{M}}_I^1(p_-, p_+)$.

The next step is to show the surjectivity of $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}_I^2(p_-, p_+) \cap U_{(\varepsilon, \rho)}(\overline{u}, \overline{w}, \overline{v})$. Let $\overline{h}$ be a map which satisfies the Lagrangian boundary conditions and (**I**) and the decay conditions (**1**) and (**1**$'$), and $\overline{h}(\tau, t) = (\alpha_h, \theta_-^h, z_-^h) \in \mathrm{Im}\iota_-$ for $-\tau_0 \leq \tau \leq \tau_0 - 2T_+\rho$ and $\overline{h}(\tau, t) = (\alpha_h, \theta_+^h, z_+^h) \in \mathrm{Im}\iota_+$ for $\tau_0 \leq \tau \leq -\tau_0 + 2T_-\rho$. Then we define $x_\rho(\tau + 2T_+\rho, t)$ by

- $\overline{h}(\tau,t)$ for $\tau \le -T_+\rho - 1/T_-$,
- $(\beta(-T_-\tau - T_-T_+\rho)\alpha_h(\tau,t) + \{1-\beta(-T_-\tau - T_-T_+\rho)\}(-T_-\tau - 2T_-T_+\rho), \beta(-T_-\tau - T_-T_+\rho)\theta^h_-(\tau,t) + \{1-\beta(-T_-\tau - T_-T_+\rho)\}(1-t), \beta(-T_-\tau - T_-T_+\rho)z^h_-(\tau,t))$ for $-T_+\rho - 1/T_- \le \tau$,

$w_\rho(\tau,t)$ by

- $(\beta(T_-\tau + T_-T_+\rho)(\alpha_h(\tau,t) + 2T_-T_+\rho), +\{1-\beta(T_-\tau + T_-T_+\rho)\}(-T_-\tau), \beta(T_-\tau + T_-T_+\rho)\theta^h_-(\tau, 1-t) + \{1-\beta(T_-\tau + T_-T_+\rho)\}(1-t), \beta(T_-\tau + T_-T_+\rho)\}z^h_-(\tau,t))$, for $\tau \le -T_+\rho + 1/T_-$,
- $(\alpha_h(\tau,t) + 2T_-T_+\rho, h(\tau,t))$, for $-T_+\rho + 1/T_- \le \tau \le T_-\rho - 1/T_+$,
- $(\beta(-T_+\tau + T_-T_+\rho)\alpha_h(\tau,t) + \{1-\beta(-T_+\tau + T_-T_+\rho)\}T_+\tau, \beta(-T_+\tau + T_-T_+\rho)\theta^h_+ + \{1-\beta(-T_+\tau + T_-T_+\rho)\}t, \beta(-T_+\tau + T_-T_+\rho)z^h_+(\tau,t))$, for $T_-\rho - 1/T_+ \le \tau$,

and $y_\rho(\tau - 2T_+\rho, t)$ by

- $(\beta(T_+\tau - T_-T_+\rho)\alpha_h(\tau,t) + \{1-\beta(T_+\tau - T_-T_+\rho)\}(T_+\tau - 2T_-T_+\rho), \beta(T_+\tau - T_-T_+\rho)\theta^h_+(\tau,t) + \{1-\beta(T_+\tau - T_-T_+\rho)\}t, \beta(T_+\tau - T_-T_+\rho)z^h_+(\tau,t))$, for $\tau \le T_-\rho + 1/T_+$,
- $\overline{h}(\tau,t)$ for $T_-\rho + 1/T_+ \le \tau$.

Moreover we define $U_{(\varepsilon,\rho_0)}(\overline{u},\overline{w},\overline{v})$, for $(\overline{u},\overline{w},\overline{v}) \in S$, to be the set of $\overline{h}$ such that, for $\rho > \rho_0$, $\overline{u} - x_\rho$ satisfies the $e^{-\frac{1}{\varepsilon}|\tau|}$-exponential decay condition (see (14)), and also $\overline{w} - z_\rho$ and $\overline{u} - y_\rho$. (For simplicity, we shall use a letter x to denote x_ρ, and also $w := w_\rho$ and $y := y_\rho$.) If $\overline{h} \in \mathcal{M}^2_I(p_-,p_+) \cap U_{(\varepsilon,\rho_0)}(\overline{u},\overline{w},\overline{v})$, then for a smooth map f_x there are constants C and C' such that

$$\begin{aligned} \|f_x(0)\|_{L^p_{0;\sigma}} &\le Ce^{-\frac{1}{\varepsilon}\rho} && (14)\\ \|N_x(\xi) - N_x(\xi')\|_{L^p_{0;\sigma}} &\le C'(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}}, && (15)\end{aligned}$$

where $\|\xi\|_{L^p_{1;\sigma}} \le c$ and $\|\xi\|_{L^p_{1;\sigma}} \le c$ and C' depends on c, and also for f_w and f_y. (The proofs of the above estimates are similar to those of (5) and (6).) We define two sections $e^0_\rho := (e^0_x, e^0_z, e^0_y)$ and $e^1_\rho := (e^1_x, e^1_z, e^1_y) \in (\langle \frac{d}{da}(a * x)|_{a=0}\rangle \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1)) \oplus (\langle \frac{d}{da}(a *

$x)|_{a=0}, \frac{d}{db}(b\sharp w)|_{b=0}\rangle \oplus L^p_{1;\sigma}(w^*TX, w^*TL_0, w^*TL_1)) \oplus (\langle \frac{d}{da}(a * x)|_{a=0}\rangle \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1))$ by

$$\begin{aligned}
e^0_\rho &:= \left(\beta(\tau - \tau_0 + 1)\frac{d}{da}(a * x)\Big|_{a=0}, \frac{1}{T_- + T_+}\left\{\frac{d}{da}(a * w)\Big|_{a=0} - T_+\frac{d}{db}(b\sharp w)\Big|_{b=0}\right\}, 0\right), \\
e^1_\rho &:= \left(0, -\frac{1}{T_- + T_+}\left\{\frac{d}{da}(a * w)\Big|_{a=0} + T_-\frac{d}{db}(b\sharp w)\Big|_{b=0}\right\}, \beta(-\tau - \tau_0 + 1)\frac{d}{da}(a * y)\Big|_{a=0}\right).
\end{aligned}$$

Define $W_{(\overline{h},\rho)} := \langle e^0_\rho, e^1_\rho\rangle$ and $H_{(\overline{h},\rho)} := W_{(\overline{h},\rho)} \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(w^*TX, w^*TL_0, w^*TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$, and the L^2-inner product on $H_{(\overline{h},\rho)}$ by

$$\begin{aligned}
&\langle \xi, \xi'\rangle_{H_{(\overline{h},\rho)}} := \langle \xi, \xi'\rangle_{L^2}, \\
&\langle e^0_\rho, \xi\rangle_{H_{(\overline{h},\rho)}} = \langle e^1_\rho, \xi\rangle_{H_{(\overline{h},\rho)}} := 0, \\
&\langle e^0_\rho, e^1_\rho\rangle_{H_{(\overline{h},\rho)}} := 0,
\end{aligned}$$

where $\xi, \xi' \in L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(w^*TX, w^*TL_0, w^*TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$. Let $W^\perp_{(\overline{h},\rho)}$ be the L^2-orthogonal compliment of $W_{(\overline{h},\rho)}$ in $H_{(\overline{h},\rho)}$.

Proposition 4.11 *There are constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $\overline{h} \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$ and $\xi := (\xi_x, \xi_w, \xi_y) \in W^\perp_{(\overline{h},\rho)}$*

$$\|\xi\|_{L^p_{1;\sigma}} \le C\|(E_x\xi_x, E_w\xi_w, E_y\xi_y)\|_{L^p_{0;\sigma}}.$$

Proof. Let $\{\varepsilon_i\}_{i=1,2,\ldots}$ and $\{\rho_i\}_{i=1,2,\ldots}$ and $\overline{h}_i \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon_i,\rho_i)}(\overline{u}, \overline{w}, \overline{v})$ be sequences such that $\varepsilon_i \to 0$ and $\rho_i \to \infty$ and there exist $\xi_i = (\xi_{x_i}, \xi_{w_i}, \xi_{y_i}) \in W^\perp_{(\overline{h}_i,\rho_i)}$ satisfying $\|\xi_i\|_{L^p_{1;\sigma}} = 1$ and $\|(E_{x_i}\xi_{x_i}, E_{w_i}\xi_{w_i}, E_{y_i}\xi_{y_i})\|_{L^p_{0;\sigma}} \to 0$. Then, in a similar way to the proof of Proposition 4.6, we can prove that there exists a subsequence $\{\xi_{i_l}\}$ such that $\|\xi_{i_l}\|_{L^p_{1;\sigma}} \to 0$, which contradicts the assumption $\|\xi_i\|_{L^p_{1;\sigma}} = 1$. ∎

Proposition 4.12 *There exist constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $\overline{h} \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$ there exists a map $G_{(\overline{h},\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(w^*TX) \oplus L^p_{0;\sigma}(y^*TX) \to W^\perp_{(\overline{h},\rho)}$ such that*

$$\begin{aligned}
(E_x \oplus E_w \oplus E_y)G_{(\overline{h},\rho)} &= \mathrm{id}, \\
\|G_{(\overline{h},\rho)}\xi\|_{L^p_{1;\sigma}} &\le C\|\xi\|_{L^p_{0;\sigma}}. \qquad (16)
\end{aligned}$$

Proof. From Proposition 4.11, if $\xi \in \mathrm{Ker}(E_x \oplus E_w \oplus E_y) \cap W^{\perp}_{(\overline{h},\rho)}$, then $\xi = 0$ and

$$\dim \mathrm{Ker}(E_x \oplus E_w \oplus E_y) \leq \dim W_{(\overline{h},\rho)}.$$

On the other hand, from Assumption 3.1,

$$\begin{aligned} \dim \mathrm{Ker}(E_x \oplus E_w \oplus E_y) &\geq \mathrm{Ind}E_{x;\sigma} + \mathrm{Ind}E_{w;\sigma} + \mathrm{Ind}E_{y;\sigma} + 2 \\ &= \dim W_{(\overline{h},\rho)}. \end{aligned}$$

Hence we obtain

$$\mathrm{Ker}(E_x \oplus E_w \oplus E_y) \oplus W^{\perp}_{(\overline{h},\rho)} = H_{(\overline{h},\rho)},$$

and $E_x \oplus E_w \oplus E_y$ is surjective. From the estimate of Proposition 4.11 we can obtain $G_{(\overline{h},\rho)}$ as in the proposition. ∎

So far we obtain the following: There are constants $\varepsilon_0 > 0$ and ρ_0 such that, for $\overline{h} \in \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$, a map $f_{(x,w,y)} := (f_x, f_w, f_y) : H_{(\rho,\varepsilon)} \to L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(w^*TX) \oplus L^p_{0;\sigma}(y^*TX)$ satisfies (14) and (15), and $Df_{(x,w,y)}(0)$ possesses a right inverse $G_{(\overline{h},\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(w^*TX) \oplus L^p_{\sigma}(y^*TX) \to H_{(\overline{h},\rho)}$ satisfying (16). If we choose ρ_0 large enough, then

$$\|G_{(\overline{h},\rho)} f_{(x,w,y)}(0)\|_{L^p_{1;\sigma}} \leq \frac{1}{8C}$$

From the Newton's method in Appendix A, we can conclude that there are constants $\varepsilon > 0$ and ρ and C' and a smooth map

$$\sharp' : \mathcal{M}^2_I(p_-, p_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v}) \to S,\ \overline{h} \mapsto (\exp_x(\xi_{\overline{h};x}), \exp_w(\xi_{\overline{h};w}), \exp_y(\xi_{\overline{h};y}))$$

with $\|\xi_{\overline{h};x}\|_{L^p_{1;\sigma}} \leq C' \|\overline{\partial}_{J_t} x\|_{L^p_{0;\sigma}}$, and also w and y. Divide them by the $\mathbf{R}$ actions, then we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}^1_I(p_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v}) \to \hat{S}$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**ii**).

Next we will prove the gluing argument (**iii**). (Most of the proof is similar to that of (**i**), we will show a sketch.) In a similar way of the proof for (**i**), for compact sets $K \subset \mathcal{M}^1_{II}(\gamma_-, q)$ and $K' \subset \mathcal{M}^1_{I}(q, p_+)$ we construct a strip $w_\chi(\tau, t)$ for $\chi := (\overline{u}, \overline{v}, \rho) \in K \times K' \times [\rho_0, \infty)$ which satisfies the Lagrangian boundary conditions and (**II**) and the decay conditions (**2**) and (**1**$'$) and

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}} \leq C e^{-d\rho},$$

where C and $d > 0$ are constants depending only on K, K' and ρ_0. Moreover, for $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$,

$$\|N_{w_\chi}(\xi) - N_{w_\chi}(\xi')\|_{L^p_{0;\sigma}} \leq C(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}},$$

where C is a constant depending only on $\|\nabla w_\chi\|_{L^p_{0;\sigma}}$ and c. We use maps $E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*L_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$ and $E_{\overline{v}} : L^p_1(\overline{v}^*TX, \overline{v}^*TL_0, \overline{v}^*L_1) \to L^p(\overline{v}^*TX)$. For $\eta \in \mathrm{Ker}E_{\overline{u}}$ and $\zeta \in \mathrm{Ker}E_{\overline{v}}$, we define similar $\eta \sharp_\rho \zeta$ as in the proof of (**i**). Let $W^\perp_{w_\chi}$ be the L^2- orthogonal compliment of $W_{w_\chi} := \{\eta \sharp_\rho \zeta | \eta \in \mathrm{Ker}E_{\overline{u}}, \zeta \in \mathrm{Ker}E_{\overline{v}}\}$ in $\langle \frac{d}{da}(a * w_\chi)|_{a=0}\rangle \oplus L^p_{1;\sigma}(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$.

Proposition 4.13 *There exist constants ρ_0 and C such that for $\chi \in K \times K' \times [\rho_0, \infty)$ and $\xi \in W^\perp_{w_\chi}$*

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\|E_{w_\chi}\xi\|_{L^p_{0;\sigma}}.$$

Proposition 4.14 *There exist constants ρ_0 and C such that for $\chi \in K \times K' \times [\rho_0, \infty)$ there exists a map $G_{w_\chi} : L^p_{0;\sigma} \to W^\perp_{w_\chi}$ such that*

$$\begin{aligned} E_{w_\chi} G_{w_\chi} &= \mathrm{id}, \\ \|G_{w_\chi}\xi\|_{L^p_{1;\sigma}} &\leq C\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants ρ_0 and C and a smooth map

$$\sharp : K \times K' \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+),\ \chi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}}$. Divide them by the $\mathbf{R}$ actions, we obtain a gluing map $\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+)$.

The next step is to show the surjectivity of $\sharp : K \times K' \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$. In a similar way of the proof for (**i**), for a map w which satisfies the Lagrangian boundary conditions and (**II**) and the decay conditions (**2**) and (**1**$'$), we define $x := x_\rho$ and $y := y_\rho$ and $U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{v})$. If $w \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$, then for a smooth map f_x there are constants C and C' and $d > 0$ such that

$$\begin{aligned} \|f_x(0)\|_{L^p_{0;\sigma}} &\leq Ce^{-d\rho}, \\ \|N_x(\xi) - N_x(\xi')\|_{L^p_{0;\sigma}} &\leq C'(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}}, \end{aligned}$$

where $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$ and C' depends on c, and also for f_y with norms $\|\cdot\|_{L^p_1}$ and $\|\cdot\|_{L^p}$. For $\xi \in \mathrm{Ker}\{E_w : \langle \frac{d}{da}(a*w)|_{a=0}\rangle \oplus L^p_{1;\sigma} \to L^p_{0;\sigma}\}$, we define similar $\hat{\xi} := (\xi_x, \xi_y) \in (\langle \frac{d}{da}(a*x)|_{a=0}\rangle \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1)) \oplus L^p_1(y^*TX, y^*TL_0, y^*TL_1)$ as in the proof of (**i**). Let $W^\perp_{(w,\rho)}$ be the L^2-orthogonal compliment of $W_{(w,\rho)} := \{\hat{\xi} | \xi \in \mathrm{Ker}E_w\}$ in $(\langle \frac{d}{da}(a*x)|_{a=0}\rangle \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1)) \oplus L^p_1(y^*TX, y^*TL_0, y^*TL_1)$.

Proposition 4.15 *There are constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $w \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ and $\xi := (\xi_x, \xi_y) \in W^\perp_{(w,\rho)}$*

$$\|\xi\|_{L^p_{1;\sigma} \oplus L^p_1} \leq C\|(E_x\xi_x, E_y\xi_y)\|_{L^p_{0;\sigma} \oplus L^p}.$$

Proposition 4.16 *There exist constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $w \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ there exists a map $G_{(w,\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p(y^*TX) \to W^\perp_{(w,\rho)}$ such that*

$$\begin{aligned} (E_x \oplus E_y)G_{(w,\rho)} &= \mathrm{id}, \\ \|G_{(w,\rho)}\xi\|_{L^p_{1;\sigma} \oplus L^p_1} &\leq C\|\xi\|_{L^p_{0;\sigma} \oplus L^p}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants $\varepsilon > 0$ and ρ and C and a smooth map

$$\sharp' : \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to K \times K', \ w \mapsto (\exp_x(\xi_{w;x}), \exp_y(\xi_{w;y}))$$

with $\|\xi_{w;x}\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} x\|_{L^p_{0;\sigma}}$ and $\|\xi_{w;y}\|_{L^p_1} \leq C\|\overline{\partial}_{J_t} y\|_{L^p}$. Divide them by the $\mathbf{R}$ actions, and we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to \hat{K} \times \hat{K}'$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**iii**).

Next we will prove the gluing argument (**iv**). (Most of the proof is similar to that of (**ii**), we will show a sketch.) Take a lift of $\hat{\mathcal{M}}^0_{III}(\gamma_-, \gamma'_-) \times \hat{\mathcal{M}}^0_{IV}(\gamma'_-, \gamma'_+) \times \hat{\mathcal{M}}^0_{II}(\gamma'_+, p_+)$ in $\mathcal{M}^1_{III}(\gamma_-, \gamma'_-) \times \mathcal{M}^2_{IV}(\gamma'_-, \gamma'_+) \times \mathcal{M}^1_{II}(\gamma'_+, p_+)$ and consider the orbit of the lift by $\mathbf{R}^2$-action: for $(a, 0) \in \mathbf{R}^2$, $(a, 0) \cdot (\overline{u}, \overline{w}, \overline{v}) := (\overline{u}, a * \overline{w}, \overline{v})$, and for $(0, b) \in \mathbf{R}^2$, $(0, b) \cdot (\overline{u}, \overline{w}, \overline{v}) := (\overline{u}, b\sharp\overline{w}, \overline{v})$. Note that the orbit is diffeomorphic to $\hat{\mathcal{M}}^0_{III}(\gamma_-, \gamma'_-) \times \hat{\mathcal{M}}^0_{IV}(\gamma'_-, \gamma'_+) \times \hat{\mathcal{M}}^0_{II}(\gamma'_+, p_+) \times \mathbf{R}^2$. We choose a compact set S in the orbit, and we will construct a gluing map $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+)$. In a similar way of the proof for (**ii**) we construct a strip $w_\chi(\tau, t)$ for $\chi := (\overline{u}, \overline{w}, \overline{v}, \rho) \in S \times [\rho_0, \infty)$ which satisfies the Lagrangian boundary conditions and (**II**) and decay conditions (**2**) and (**1**$'$) and

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}} \leq Ce^{-d\rho},$$

where C and $d > 0$ are constants depending only on S and ρ_0. Moreover, for $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$,

$$\|N_{w_\chi}(\xi) - N_{w_\chi}(\xi')\|_{L^p_{0;\sigma}} \leq C(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}},$$

where C is a constant depending only on $\|\nabla w_\chi\|_{L^p_{0;\sigma}}$ and c. We define similar e^0_ρ and e^1_ρ as in the proof of (**ii**). Let $W^\perp_{w_\chi}$ be the L^2- orthogonal compliment of $W_{w_\chi} := \langle -\beta(-\tau - 2\tau_0 - 2T_-\rho)\frac{d}{da}(a * \overline{u})|_{a=0}(\tau + 2T_-\rho, t) + e^0_\rho, e^1_\rho \rangle$ in $\langle \frac{d}{da}(a * w_\chi)|_{a=0}\rangle \oplus L^p_{1;\sigma}(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$.

Proposition 4.17 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0, \infty)$ and $W^\perp_{w_\chi}$*

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\rho^{\frac{3}{2} - \frac{1}{p}}\|E_{w_\chi}\xi\|_{L^p_{0;\sigma}}.$$

Proposition 4.18 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0, \infty)$ there exists a map $G_{w_\chi} : L^p_{0;\sigma} \to W^\perp_{w_\chi}$ such that*

$$\begin{aligned} E_{w_\chi} G_{w_\chi} &= \mathrm{id}, \\ \|G_{w_\chi}\xi\|_{L^p_{1;\sigma}} &\leq C\rho^{\frac{3}{2} - \frac{1}{p}}\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants ρ_0 and C and a smooth map

$$\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+),\ \xi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}}$. Divide them by the $\mathbf{R}$ actions, we obtain a gluing map $\hat{\sharp} : \hat{S} \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+)$.

The next step is to show the surjectivity of $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+)$. In a similar way of the proof for (**ii**), for a map $\overline{h}$ which satisfies the Lagrangian boundary conditions and (**II**) and the decay conditions (**2**) and (**1**$'$), we define $x := x_\rho$, $w := w_\rho$ and $y := y_\rho$ and $U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$. If $\overline{h} \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$, then for a smooth map f_x there are constants C and C'

$$\begin{aligned}
\|f_x(0)\|_{L^p_{0;\sigma}} &\leq Ce^{-\frac{1}{\varepsilon}\rho}, \\
\|N_x(\xi) - N_x(\xi')\|_{L^p_{0;\sigma}} &\leq C'(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}},
\end{aligned}$$

where $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$ and C' depend on c, and also for f_w and f_y. We define similar e^0_ρ and e^1_ρ as in the proof of (**ii**). Define $W_{(\overline{h},\rho)} := \langle -\beta(-\tau - \tau_0)\frac{d}{da}(a * x)|_{a=0} + e^0_\rho, e^1_\rho \rangle$ and $H_{(\overline{h},\rho)} := W_{(\overline{h},\rho)} \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(w^*TX, w^*TL_0, w^*TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$ and the L^2-inner product on $H_{(\overline{h},\rho)}$ by

$$\begin{aligned}
&\langle \xi, \xi' \rangle_{H_{(\overline{h},\rho)}} := \langle \xi, \xi' \rangle_{L^2}, \\
&\left\langle -\beta(-\tau - \tau_0)\frac{d}{da}(a * x)\Big|_{a=0} + e^0_\rho, \xi \right\rangle_{H_{(\overline{h},\rho)}} = \langle e^1_\rho, \xi \rangle_{H_{(\overline{h},\rho)}} := 0, \\
&\left\langle -\beta(\tau + \tau_0)\frac{d}{da}(a * x)\Big|_{a=0} + e^0_\rho, e^1_\rho \right\rangle_{H_{(\overline{h},\rho)}} := 0,
\end{aligned}$$

where $\xi, \xi' \in L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(w^*TX, w^*TL_0, w^*TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$. Let $W^\perp_{(\overline{h},\rho)}$ be the L^2-orthogonal compliment of $W_{(\overline{h},\rho)}$ in $H_{(\overline{h},\rho)}$.

Proposition 4.19 *There are constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $\overline{h} \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$ and $\xi := (\xi_x, \xi_w, \xi_y) \in W^\perp_{(\overline{h},\rho)}$*

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\|(E_x\xi_x, E_w\xi_w, E_y\xi_y)\|_{L^p_{0;\sigma}}.$$

Proposition 4.20 *There exist constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $\overline{h} \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$ *there exists a map* $G_{(\overline{h},\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(w^*TX) \oplus L^p_{0;\sigma}(y^*TX) \to W^{\perp}_{(\overline{h},\rho)}$ *such that*

$$\begin{aligned}(E_x \oplus E_w \oplus E_y)G_{(\overline{h},\rho)} &= \mathrm{id},\\ \|G_{(\overline{h},\rho)}\xi\|_{L^p_{1;\sigma}} &\le C\|\xi\|_{L^p_{0;\sigma}}.\end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants $\varepsilon > 0$ and ρ and C and a smooth map

$$\sharp' : \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v}) \to S,\ \overline{h} \mapsto (\exp_x(\xi_{\overline{h};x}), \exp_w(\xi_{\overline{h};w}), \exp_y(\xi_{\overline{h};y}))$$

with $\|\xi_{\overline{h};x}\|_{L^p_{1;\sigma}} \le C\|\overline{\partial}_{J_t}x\|_{L^p_{0;\sigma}}$, and also w and y. Divide them by the $\mathbf{R}$ actions, then we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v}) \to \hat{S}$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**iv**).

Next we will prove the gluing argument (**v**). (Most of the proof is similar to that of (**ii**), we will show a sketch.) Take a lift of $\hat{\mathcal{M}}^0_V(\gamma_-, \gamma) \times \hat{\mathcal{M}}^0_{II}(\gamma, p_+)$ in $\mathcal{M}^2_V(\gamma_-, \gamma) \times \mathcal{M}^1_{II}(\gamma, p_+)$ and consider the orbit of the lift by $\mathbf{R}^2$-action: for $(a, 0) \in \mathbf{R}^2$, $(a, 0)\cdot(\overline{u}, \overline{v}) := (a{*}\overline{u}, \overline{v})$, and for $(0, b) \in \mathbf{R}^2$, $(0, b) \cdot (b\sharp\overline{u}, \overline{v})$. Note that the orbit is diffeomorphic to $\hat{\mathcal{M}}^0_V(\gamma_-, \gamma) \times \hat{\mathcal{M}}^0_{II}(\gamma, p_+) \times \mathbf{R}^2$. We choose a compact set S in the orbit, and we will construct a gluing map $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+)$. In a similar way of the proof for (**ii**) we construct a strip $w_\chi(\tau, t)$ for $\chi := (\overline{u}, \overline{v}, \rho) \in S \times [\rho_0, \infty)$ which satisfies the Lagrangian boundary conditions and (**II**) and decay conditions (**2**) and (**1**$'$) and

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}} \le Ce^{-d\rho},$$

where C and $d > 0$ are constants depending only on S and ρ_0. Moreover, for $\|\xi\|_{L^p_{1;\sigma}} \le c$ and $\|\xi'\|_{L^p_{1;\sigma}} \le c$,

$$\|N_{w_\chi}(\xi) - N_{w_\chi}(\xi')\|_{L^p_{0;\sigma}} \le C(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}},$$

where C is a constant depending only on $\|\nabla w_\chi\|_{L^p_{0;\sigma}}$ and c. We define similar e^0_ρ and e^1_ρ as in the proof of (**ii**). Let $W^{\perp}_{w_\chi}$ be the L^2- orthogonal compliment of $W_{w_\chi} := \langle e^0_\rho, e^1_\rho\rangle$ in $\langle \frac{d}{da}(a{*}w_\chi)|_{a=0}\rangle \oplus L^p_{1;\sigma}(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$.

Proposition 4.21 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0, \infty)$ and $W^{\perp}_{w_\chi}$*

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\rho^{\frac{3}{2}-\frac{1}{p}} \|E_{w_\chi}\xi\|_{L^p_{0;\sigma}}.$$

Proposition 4.22 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0, \infty)$ there exists a map $G_{w_\chi} : L^p_{0;\sigma} \to W^{\perp}_{w_\chi}$ such that*

$$\begin{aligned} E_{w_\chi} G_{w_\chi} &= \mathrm{id}, \\ \|G_{w_\chi}\xi\|_{L^p_{1;\sigma}} &\leq C\rho^{\frac{3}{2}-\frac{1}{p}} \|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants ρ_0 and C and a smooth map

$$\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+),\ \xi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}}$. Divide them by the $\mathbf{R}$ actions, we obtain a gluing map $\hat{\sharp} : \hat{S} \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+)$.

The next step is to show the surjectivity of $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{II}(\gamma_-, p_+)$. In a similar way of the proof for (**ii**), for a map $\overline{h}$ which satisfies the Lagrangian boundary conditions and (**II**) and the decay conditions (**2**) and (**1′**), we define $x := x_\rho$ and $y := y_\rho$ and $U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{v})$. If $\overline{h} \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{v})$, then for a smooth map f_x there are constants C and C'

$$\begin{aligned} \|f_x(0)\|_{L^p_{0;\sigma}} &\leq Ce^{-\frac{1}{\varepsilon}\rho}, \\ \|N_x(\xi) - N_x(\xi')\|_{L^p_{0;\sigma}} &\leq C'(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}}, \end{aligned}$$

where $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$ and C' depend on c, and also for f_y. Define $W_{(\overline{h},\rho)} := \langle e^0_\rho, e^1_\rho \rangle$ and $H_{(\overline{h},\rho)} := W_{(\overline{h},\rho)} \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$, and the L^2-inner product on $H_{(\overline{h},\rho)}$ in a similar way to that of (**ii**). Let $W^{\perp}_{(\overline{h},\rho)}$ be the L^2-orthogonal compliment of $W_{(\overline{h},\rho)}$ in $H_{(\overline{h},\rho)}$.

Proposition 4.23 *There are constants $\varepsilon_0 > 0$ and ρ_0 and C such that for $\overline{h} \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ and $\xi := (\xi_x, \xi_y) \in W^{\perp}_{(\overline{h},\rho)}$*

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\|(E_x\xi_x, E_y\xi_y)\|_{L^p_{0;\sigma}}.$$

Proposition 4.24 *There exist constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $\overline{h} \in \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ *there exists a map* $G_{(\overline{h},\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(y^*TX) \to W^{\perp}_{(\overline{h},\rho)}$ *such that*

$$\begin{aligned} (E_x \oplus E_y)G_{(\overline{h},\rho)} &= \mathrm{id}, \\ \|G_{(\overline{h},\rho)}\xi\|_{L^p_{1;\sigma}} &\le C\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants $\varepsilon > 0$ and ρ and C and a smooth map

$$\sharp' : \mathcal{M}^2_{II}(\gamma_-, p_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to S,\ \overline{h} \mapsto (\exp_x(\xi_{\overline{h};x}), \exp_y(\xi_{\overline{h};y}))$$

with $\|\xi_{\overline{h};x}\|_{L^p_{1;\sigma}} \le C\|\overline{\partial}_{J_t}x\|_{L^p_{0;\sigma}}$, and also y. Divide them by the $\mathbf{R}$ actions, then we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}^1_{II}(\gamma_-, p_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to \hat{S}$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**v**).

Next we will prove the gluing argument (**vi**). (Most of the proof is similar to that of (**i**), we will show a sketch.) In a similar way to the proof for (**i**), for compact sets $K \subset \mathcal{M}^1_{II}(\gamma_-, q)$ and $K' \subset \mathcal{M}^1_{II'}(q, \gamma_+)$ we construct a strip $w_\chi(\tau, t)$ for $\chi := (\overline{u}, \overline{v}, \rho) \in K \times K' \times [\rho_0, \infty)$ which satisfies the Lagrangian boundary conditions and (**III**) and the decay conditions (**2**) and (**2**$'$) and

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}} \le Ce^{-d\rho},$$

where C and $d > 0$ are constants depending only on K, K' and ρ_0. Moreover, for $\|\xi\|_{L^p_{1;\sigma}} \le c$ and $\|\xi'\|_{L^p_{1;\sigma}} \le c$,

$$\|N_{w_\chi}(\xi) - N_{w_\chi}(\xi')\|_{L^p_{0;\sigma}} \le C(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}},$$

where C is a constant depending only on $\|\nabla w_\chi\|_{L^p_{0;\sigma}}$ and c. We use maps $E_{\overline{u}} : \langle \frac{d}{da}(a * \overline{u})|_{a=0}\rangle \oplus L^p_{1;\sigma}(\overline{u}^*TX, \overline{u}^*TL_0, \overline{u}^*L_1) \to L^p_{0;\sigma}(\overline{u}^*TX)$ and $E_{\overline{v}} : \langle \frac{d}{da}(a * \overline{v})|_{a=0}\rangle \oplus L^p_1(\overline{v}^*TX, \overline{v}^*TL_0, \overline{v}^*L_1) \to L^p(\overline{v}^*TX)$. For $\eta \in \mathrm{Ker}E_{\overline{u}}$ and $\zeta \in \mathrm{Ker}E_{\overline{v}}\}$, we define similar $\eta\sharp_\rho\zeta$ as in the proof of (**i**). Let $W^{\perp}_{w_\chi}$ be the L^2- orthogonal compliment of $W_{w_\chi} := \{\eta\sharp_\rho\zeta | \eta \in \mathrm{Ker}E_{\overline{u}}, \zeta \in \mathrm{Ker}E_{\overline{v}}\}$ in $\langle \frac{d}{da}(a * w_\chi)|_{a=0}\rangle \oplus L^p_{1;\sigma}(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$.

Proposition 4.25 *There exist constants* ρ_0 *and* C *such that for* $\chi \in K \times K' \times [\rho_0, \infty)$ *and* $\xi \in W^{\perp}_{w_\chi}$

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\|E_{w_\chi}\xi\|_{L^p_{0;\sigma}}.$$

Proposition 4.26 *There exist constants* ρ_0 *and* C *such that for* $\chi \in K \times K' \times [\rho_0, \infty)$ *there exists a map* $G_{w_\chi} : L^p_{0;\sigma} \to W^{\perp}_{w_\chi}$ *such that*

$$\begin{aligned} E_{w_\chi}G_{w_\chi} &= \mathrm{id}, \\ \|G_{w_\chi}\xi\|_{L^p_{1;\sigma}} &\leq C\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants ρ_0 and C and a smooth map

$$\sharp : K \times K' \times [\rho_0, \infty) \to \mathcal{M}^2_{III}(\gamma_-, \gamma_+),\ \chi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}}$. Divide them by the $\mathbf{R}$ actions, we obtain a gluing map $\hat{\sharp} : \hat{K} \times \hat{K}' \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+)$.

The next step is to show the surjectivity of $\sharp : K \times K' \times [\rho_0, \infty) \to \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$. In a similar way to the proof for (**i**), for a map w which satisfies the Lagrangian boundary conditions and (**III**) and the decay conditions (**2**) and (**2′**), we define $x := x_\rho$ and $y := y_\rho$ and $U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{v})$. If $w \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v})$, then for a smooth map f_x there are constants C and C' and $d > 0$ such that

$$\begin{aligned} \|f_x(0)\|_{L^p_{0;\sigma}} &\leq Ce^{-d\rho}, \\ \|N_x(\xi) - N_x(\xi')\|_{L^p_{0;\sigma}} &\leq C'(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}}, \end{aligned}$$

where $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$ and C' depends on c, and also for f_y. For $\xi \in \mathrm{Ker}\{E_w : \langle \frac{d}{da}(a * w)|_{a=0}\rangle \oplus L^p_{1;\sigma} \to L^p_{0;\sigma}\}$, we define similar $\hat{\xi} := (\xi_x, \xi_y) \in (\langle \frac{d}{da}(a*x)|_{a=0}\rangle \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1)) \oplus (\langle \frac{d}{da}(a*y)|_{a=0}\rangle \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1))$ as in the proof of (**i**). Let $W^{\perp}_{(w,\rho)}$ be the L^2-orthogonal compliment of $W_{(w,\rho)} := \{\hat{\xi} | \xi \in \mathrm{Ker}E_w\}$ in $(\langle \frac{d}{da}(a * x)|_{a=0}\rangle \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1)) \oplus (\langle \frac{d}{da}(a*y)|_{a=0}\rangle \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1))$.

Proposition 4.27 *There are constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $w \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ *and* $\xi := (\xi_x, \xi_y) \in W^{\perp}_{(w,\rho)}$

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\|(E_x\xi_x, E_y\xi_y)\|_{L^p_{0;\sigma}}.$$

Proposition 4.28 *There exist constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $w \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ *there exists a map* $G_{(w,\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(y^*TX) \to W^{\perp}_{(w,\rho)}$ *such that*

$$\begin{aligned} (E_x \oplus E_y)G_{(w,\rho)} &= \mathrm{id}, \\ \|G_{(w,\rho)}\xi\|_{L^p_{1;\sigma}} &\leq C\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants $\varepsilon > 0$ and ρ and C and a smooth map

$$\sharp' : \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to K \times K',\ w \mapsto (\exp_x(\xi_{w;x}), \exp_y(\xi_{w;y}))$$

with $\|\xi_{w;x}\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t}x\|_{L^p_{0;\sigma}}$ and $\|\xi_{w;y}\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t}y\|_{L^p_{0;\sigma}}$. Divide by the $\mathbf{R}$ actions, and we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{v}) \to \hat{K} \times \hat{K}'$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**vi**).

Next we will prove the gluing argument (**vii**). (Most of the proof is similar to that of (**ii**), we will show a sketch.) Take a lift of $\hat{\mathcal{M}}^0_{III}(\gamma_-, \gamma'_-) \times \hat{\mathcal{M}}^0_{IV}(\gamma'_-, \gamma'_+) \times \hat{\mathcal{M}}^0_{III}(\gamma'_+, \gamma_+)$ in $\mathcal{M}^1_{III}(\gamma_-, \gamma'_-) \times \mathcal{M}^2_{IV}(\gamma'_-, \gamma'_+) \times \mathcal{M}^1_{III}(\gamma'_+, \gamma_+)$ and consider the orbit of the lift by the similar $\mathbf{R}^2$-action to that of (**ii**). Note that the orbit is diffeomorphic to $\hat{\mathcal{M}}^0_{III}(\gamma_-, \gamma'_-) \times \hat{\mathcal{M}}^0_{IV}(\gamma'_-, \gamma'_+) \times \hat{\mathcal{M}}^0_{III}(\gamma'_+, \gamma_+) \times \mathbf{R}^2$. We choose a compact set S in the orbit, and we will construct a gluing map $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{III}(\gamma_-, \gamma_+)$. In a similar way of the proof for (**ii**) we construct a strip $w_\chi(\tau, t)$ for $\chi := (\overline{u}, \overline{w}, \overline{v}, \rho) \in S \times [\rho_0, \infty)$ which satisfies the Lagrangian boundary conditions and (**III**) and decay conditions (**2**) and (**2′**) and

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}} \leq Ce^{-d\rho},$$

where C and $d > 0$ are constants depending only on S and ρ_0. Moreover, for $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$,

$$\|N_{w_\chi}(\xi) - N_{w_\chi}(\xi')\|_{L^p_{0;\sigma}} \leq C(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}},$$

where C is a constant depending only on $\|\nabla w_\chi\|_{L^p_{0;\sigma}}$ and c. We define similar e^0_ρ and e^1_ρ as in the proof of (**ii**). Let $W^\perp_{w_\chi}$ be the L^2-orthogonal compliment of $W_{w_\chi} := \langle -\beta(-\tau - 2\tau_0 - 2T_-\rho)\frac{d}{da}(a * \overline{u}|_{a=0}(\tau + 2T_-\rho, t) + e^0_\rho, \beta(\tau - 2\tau_0 - 2T_+\rho)\frac{d}{da}(a * \overline{w})|_{a=0}(\tau - 2T_+\rho, t) + e^1_\rho\rangle$ in $\langle \frac{d}{da}(a * w_\chi)|_{a=0}\rangle \oplus L^p_{1;\sigma}(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$.

Proposition 4.29 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0, \infty)$ and $W^\perp_{w_\chi}$*

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\rho^{\frac{3}{2} - \frac{1}{p}}\|E_{w_\chi}\xi\|_{L^p_{0;\sigma}}.$$

Proposition 4.30 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0, \infty)$ there exists a map $G_{w_\chi} : L^p_{0;\sigma} \to W^\perp_{w_\chi}$ such that*

$$\begin{aligned} E_{w_\chi}G_{w_\chi} &= \mathrm{id}, \\ \|G_{w_\chi}\xi\|_{L^p_{1;\sigma}} &\leq C\rho^{\frac{3}{2} - \frac{1}{p}}\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants ρ_0 and C and a smooth map

$$\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{III}(\gamma_-, \gamma_+), \ \xi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}}$. Divide them by the $\mathbf{R}$ actions, we obtain a gluing map $\hat{\sharp} : \hat{S} \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+)$.

The next step is to show the surjectivity of $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{III}(\gamma_-, \gamma_+)$. In a similar way of the proof for (**ii**), for a map $\overline{h}$ which satisfies the Lagrangian boundary conditions and (**III**) and the decay conditions (**2**) and (**2′**), we define $x := x_\rho$, $w := w_\rho$ and $y := y_\rho$ and $U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$. If $\overline{h} \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$, then for a smooth map f_x there are constants C and C'

$$\begin{aligned} \|f_x(0)\|_{L^p_{0;\sigma}} &\leq Ce^{-\frac{1}{\varepsilon}\rho}, \\ \|N_x(\xi) - N_x(\xi')\|_{L^p_{0;\sigma}} &\leq C'(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}}, \end{aligned}$$

where $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$ and C' depend on c, and also for f_w and f_y. We define similar e^0_ρ and e^1_ρ as in the proof (**ii**). Define $W_{(\overline{h},\rho)} := \langle -\beta(-\tau-\tau_0)\frac{d}{da}(a*x)|_{a=0} + e^0_\rho, \beta(\tau-\tau_0)\frac{d}{da}(a*y)|_{a=0} + e^1_\rho \rangle$ and $H_{(\overline{h},\rho)} := W_{(\overline{h},\rho)} \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(w^*TX, w^*TL_0, w^TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$ and the L^2-inner product on $H_{(\overline{h},\rho)}$ by

$$\begin{aligned}
&\langle \xi, \xi' \rangle_{H_{(\overline{h},\rho)}} := \langle \xi, \xi' \rangle_{L^2},\\
&\left\langle -\beta(-\tau-\tau_0)\frac{d}{da}(a*x)\Big|_{a=0} + e^0_\rho, \xi \right\rangle_{H_{(\overline{h},\rho)}} := \left\langle \beta(\tau-\tau_0)\frac{d}{da}(a*y)\Big|_{a=0} + e^1_\rho, \xi \right\rangle_{H_{(\overline{h},\rho)}} := 0,\\
&\left\langle -\beta(-\tau-\tau_0)\frac{d}{da}(a*x)\Big|_{a=0} + e^0_\rho, \beta(\tau-\tau_0)\frac{d}{da}(a*y)\Big|_{a=0} + e^1_\rho \right\rangle_{H_{(\overline{h},\rho)}} := 0,
\end{aligned}$$

where $\xi, \xi' \in L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(w^*TX, w^*TL_0, w^TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$. Let $W^\perp_{(\overline{h},\rho)}$ be the L^2-orthogonal compliment of $W_{(\overline{h},\rho)}$ in $H_{(\overline{h},\rho)}$.

Proposition 4.31 *There are constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $\overline{h} \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$ *and* $\xi := (\xi_x, \xi_w, \xi_y) \in W^\perp_{(\overline{h},\rho)}$

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\|(E_x\xi_x, E_w\xi_w, E_y\xi_y)\|_{L^p_{0;\sigma}}.$$

Proposition 4.32 *There exist constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $\overline{h} \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{w}, \overline{v})$ *there exists a map* $G_{(\overline{h},\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(w^*TX) \oplus L^p_{0;\sigma}(y^*TX) \to W^\perp_{(\overline{h},\rho)}$ *such that*

$$\begin{aligned}
(E_x \oplus E_w \oplus E_y)G_{(\overline{h},\rho)} &= \mathrm{id},\\
\|G_{(\overline{h},\rho)}\xi\|_{L^p_{1;\sigma}} &\leq C\|\xi\|_{L^p_{0;\sigma}}.
\end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants $\varepsilon > 0$ and ρ and C and a smooth map

$$\sharp' : \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v}) \to S,\ \overline{h} \mapsto (\exp_x(\xi_{\overline{h};x}), \exp_w(\xi_{\overline{h};w}), \exp_y(\xi_{\overline{h};y}))$$

with $\|\xi_{\overline{h};x}\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t}x\|_{L^p_{0;\sigma}}$, and also w and y. Divide them by the $\mathbf{R}$ actions, then we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u}, \overline{w}, \overline{v}) \to \hat{S}$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**vii**).

Finally we will prove the gluing argument (**viii**). (Most of the proof is similar to that of (**ii**), we will show a sketch.) Take a lift of $\hat{\mathcal{M}}^0_V(\gamma_-,\gamma) \times \hat{\mathcal{M}}^0_{III}(\gamma,\gamma_+)$ in $\mathcal{M}^2_V(\gamma_-,\gamma) \times \mathcal{M}^1_{III}(\gamma,\gamma_+)$ and consider the orbit of the lift by the similar $\mathbf{R}^2$-action to that of (**v**). Note that the orbit is diffeomorphic to $\hat{\mathcal{M}}^0_V(\gamma_-,\gamma) \times \hat{\mathcal{M}}^0_{III}(\gamma,\gamma_+) \times \mathbf{R}^2$. We choose a compact set S in the orbit, and we will construct a gluing map $\sharp : S \times [\rho_0,\infty) \to \mathcal{M}^2_{III}(\gamma_-,\gamma_+)$. In a similar way to the proof for (**ii**) we construct a strip $w_\chi(\tau,t)$ for $\chi := (\overline{u},\overline{v},\rho) \in S \times [\rho_0,\infty)$ which satisfies the Lagrangian boundary conditions and (**III**) and decay conditions (**2**) and (**2′**) and

$$\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}} \leq Ce^{-d\rho},$$

where C and $d > 0$ are constants depending only on S and ρ_0. Moreover, for $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$,

$$\|N_{w_\chi}(\xi) - N_{w_\chi}(\xi')\|_{L^p_{0;\sigma}} \leq C(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{1;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}},$$

where C is a constant depending only on $\|\nabla w_\chi\|_{L^p_{0;\sigma}}$ and c. We define similar e^0_ρ and e^1_ρ as in the proof of (**ii**). Let $W^\perp_{w_\chi}$ be the L^2- orthogonal compliment of $W_{w_\chi} := \{e^0_\rho, \beta(\tau - 2\tau_0 - 2T\rho)\frac{d}{da}(a*\overline{v})|_{a=0}(\tau - 2T\rho, t) + e^1_\rho\}$ in $\langle \frac{d}{da}(a * w_\chi)|_{a=0}\rangle \oplus L^p_{1;\sigma}(w^*_\chi TX, w^*_\chi TL_0, w^*_\chi TL_1)$.

Proposition 4.33 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0,\infty)$ and $W^\perp_{w_\chi}$*

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\rho^{\frac{3}{2}-\frac{1}{p}}\|E_{w_\chi}\xi\|_{L^p_{0;\sigma}}.$$

Proposition 4.34 *There exist constants ρ_0 and C such that for $\chi \in S \times [\rho_0,\infty)$ there exists a map $G_{w_\chi} : L^p_{0;\sigma} \to W^\perp_{w_\chi}$ such that*

$$\begin{aligned} E_{w_\chi}G_{w_\chi} &= \mathrm{id}, \\ \|G_{w_\chi}\xi\|_{L^p_{1;\sigma}} &\leq C\rho^{\frac{3}{2}-\frac{1}{p}}\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants ρ_0 and C and a smooth map

$$\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{III}(\gamma_-, \gamma_+),\ \xi \mapsto \exp_{w_\chi}(\xi_\chi)$$

with $\|\xi_\chi\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} w_\chi\|_{L^p_{0;\sigma}}$. Divide them by the $\mathbf{R}$ actions, we obtain a gluing map $\hat{\sharp} : \hat{S} \times [\rho_0, \infty) \to \hat{\mathcal{M}}^1_{III}(\gamma_-, \gamma_+)$.

The next step is to show the surjectivity of $\sharp : S \times [\rho_0, \infty) \to \mathcal{M}^2_{III}(\gamma_-, \gamma_+)$. In a similar way of the proof for (**ii**), for a map $\overline{h}$ which satisfies the Lagrangian boundary conditions and (**III**) and the decay conditions (**2**) and (**2′**), we define $x := x_\rho$ and $y := y_\rho$ and $U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{v})$. If $\overline{h} \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon,\rho_0)}(\overline{u}, \overline{v})$, then for a smooth map f_x there are constants C and C'

$$\begin{aligned} \|f_x(0)\|_{L^p_{0;\sigma}} &\leq Ce^{-\frac{1}{\varepsilon}\rho}, \\ \|N_x(\xi) - N_x(\xi')\|_{L^p_{0;\sigma}} &\leq C'(\|\xi\|_{L^p_{1;\sigma}} + \|\xi'\|_{L^p_{;\sigma}})\|\xi - \xi'\|_{L^p_{1;\sigma}}, \end{aligned}$$

where $\|\xi\|_{L^p_{1;\sigma}} \leq c$ and $\|\xi'\|_{L^p_{1;\sigma}} \leq c$ and C' depend on c, and also for f_y. Define $W_{(\overline{h},\rho)} := \langle e^0_\rho, e^1_\rho \rangle$ and $H_{(\overline{h},\rho)} := W_{(\overline{h},\rho)} \oplus L^p_{1;\sigma}(x^*TX, x^*TL_0, x^*TL_1) \oplus L^p_{1;\sigma}(y^*TX, y^*TL_0, y^*TL_1)$, and the L^2-inner product on $H_{(\overline{h},\rho)}$ in a similar way to that of (**v**). Let $W^\perp_{(\overline{h},\rho)}$ be the L^2-orthogonal compliment of $W_{(\overline{h},\rho)}$ in $H_{(\overline{h},\rho)}$.

Proposition 4.35 *There are constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $\overline{h} \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ *and* $\xi := (\xi_x, \xi_y) \in W^\perp_{(\overline{h},\rho)}$

$$\|\xi\|_{L^p_{1;\sigma}} \leq C\|(E_x\xi_x, E_y\xi_y)\|_{L^p_{0;\sigma}}.$$

Proposition 4.36 *There exist constants* $\varepsilon_0 > 0$ *and* ρ_0 *and* C *such that for* $\overline{h} \in \mathcal{M}^2_{III}(\gamma_-, \gamma_+) \cap U_{(\varepsilon_0,\rho_0)}(\overline{u}, \overline{v})$ *there exists a map* $G_{(\overline{h},\rho)} : L^p_{0;\sigma}(x^*TX) \oplus L^p_{0;\sigma}(y^*TX) \to W^\perp_{(\overline{h},\rho)}$ *such that*

$$\begin{aligned} (E_x \oplus E_y)G_{(\overline{h},\rho)} &= \mathrm{id}, \\ \|G_{(\overline{h},\rho)}\xi\|_{L^p_{1;\sigma}} &\leq C\|\xi\|_{L^p_{0;\sigma}}. \end{aligned}$$

From these propositions and the Newton's method, we can conclude that there are constants $\varepsilon > 0$ and ρ and C and a smooth map

$$\sharp' : \mathcal{M}^2_{III}(\gamma_-,\gamma_+) \cap U_{(\varepsilon,\rho)}(\overline{u},\overline{v}) \to S,\ \overline{h} \mapsto (\exp_x(\xi_{\overline{h};x}), \exp_y(\xi_{\overline{h};y}))$$

with $\|\xi_{\overline{h};x}\|_{L^p_{1;\sigma}} \leq C\|\overline{\partial}_{J_t} x\|_{L^p_{0;\sigma}}$, and also y. Divide them by the $\mathbf{R}$ actions, then we obtain a map $\hat{\sharp}' : \hat{\mathcal{M}}^1_{III}(\gamma_-,\gamma_+) \cap \hat{U}_{(\varepsilon,\rho)}(\overline{u},\overline{v}) \to \hat{S}$.

From the construction of $\sharp$ and $\sharp'$, if ρ_0 is large and ε is small enough, then $\sharp \circ \sharp'$ and $\sharp' \circ \sharp$ are diffeomorphisms. We finish proving the gluing argument (**viii**).

We observe the dimensions of the moduli spaces in gluing arguments. For example, we consider the following case. Take a lift of

$$\begin{aligned}\hat{\mathcal{M}}^{e_0}_{II'}(p_-,\gamma^1_-) \times \hat{\mathcal{M}}^{d_1}_{IV}(\gamma^1_-,\gamma^1_+) \times \hat{\mathcal{M}}^{e_1}_{III}(\gamma^1_+,\gamma^2_-) \times \hat{\mathcal{M}}^{d_2}_{IV}(\gamma^2_-,\gamma^2_+) \times \cdots \\ \times \hat{\mathcal{M}}^{e_{k-1}}_{III}(\gamma^{k-1}_+,\gamma^k_-) \times \hat{\mathcal{M}}^{d_k}_{IV}(\gamma^k_-,\gamma^k_+) \times \hat{\mathcal{M}}^{e_k}_{II}(\gamma^k_+,p_+)\end{aligned}$$

in

$$\begin{aligned}\mathcal{M}^{e_0+1}_{II'}(p_-,\gamma^1_-) \times \mathcal{M}^{d_1+2}_{IV}(\gamma^1_-,\gamma^1_+) \times \mathcal{M}^{e_1+1}_{III}(\gamma^1_+,\gamma^2_-) \times \mathcal{M}^{d_2+2}_{IV}(\gamma^2_-,\gamma^2_+) \times \cdots \\ \times \mathcal{M}^{e_{k-1}+1}_{III}(\gamma^{k-1}_+,\gamma^k_-) \times \mathcal{M}^{d_k+2}_{IV}(\gamma^k_-,\gamma^k_+) \times \mathcal{M}^{e_k+1}_{II}(\gamma^k_+,p_+)\end{aligned}$$

and consider the orbit of the lift by the following $\mathbf{R}^{2k}$-action:
for $((0,0),\ldots,(a_l,0),\ldots,(0,0)) \in \mathbf{R}^{2k}$

$$\begin{aligned} & ((0,0)\ldots,(a_l,0),\ldots,(0,0)) \cdot (\overline{u}_0,\overline{w}_1,\overline{u}_1,\ldots,\overline{w}_k,\overline{u}_k) \\ := \ & (\overline{u}_0,\overline{w}_1,\overline{u}_1,\ldots,a * \overline{w}_l,\ldots,\overline{w}_k,\overline{u}_k),\end{aligned}$$

and for $((0,0),\ldots,(0,b_l),\ldots,(0,0)) \in \mathbf{R}^{2k}$

$$\begin{aligned} & ((0,0),\ldots,(0,b_l),\ldots,(0,0)) \cdot (\overline{u}_0,\overline{w}_1,\overline{u}_1,\ldots,\overline{w}_k,\overline{u}_k) \\ := \ & (\overline{u}_0,\overline{w}_1,\overline{u}_1,\ldots,b_l \sharp \overline{w}_l,\ldots \overline{w}_k,\overline{u}_k).\end{aligned}$$

Then the orbit is diffeomorphic to

$$\begin{aligned}\hat{\mathcal{M}}^{e_0}_{II'}(p_-,\gamma^1_-) \times \hat{\mathcal{M}}^{d_1}_{IV}(\gamma^1_-,\gamma^1_+) \times \hat{\mathcal{M}}^{e_1}_{III}(\gamma^1_+,\gamma^2_-) \times \hat{\mathcal{M}}^{d_2}_{IV}(\gamma^2_-,\gamma^2_+) \times \cdots \\ \times \hat{\mathcal{M}}^{e_{k-1}}_{III}(\gamma^{k-1}_+,\gamma^k_-) \times \hat{\mathcal{M}}^{d_k}_{IV}(\gamma^k_-,\gamma^k_+) \times \hat{\mathcal{M}}^{e_k}_{II}(\gamma^k_+,p_+) \times \mathbf{R}^{2k},\end{aligned}$$

and we can construct a smooth map

$$\sharp : S \times [\rho_0, \infty) \to \mathcal{M}_I^{e_0+\cdots+d_k+e_k+2k}(p_-, p_+),$$

where S is a compact set in the orbit and ρ_0 is a constant depending on S. Divide them by the $\mathbf{R}$-actions, then we obtain a gluing map $\hat{\sharp} : \hat{S} \to \hat{\mathcal{M}}_I^{e_0+\cdots+d_k+e_k+2k-1}(p_-, p_+)$. This implies that each element of $\hat{\mathcal{M}}_I^{d_l}(\gamma_-^l, \gamma_+^l)$ contribute dimension 2 to $\sum_{i=0}^k e_i + \sum_{j=1}^k d_l + 2k$, the dimension of $\mathcal{M}_I^{e_0+\cdots+d_k+e_k+2k}(p_-, p_+)$.

5 Bubbling off phenomena for pseudo-holomorphic curves

We owe most of this section to [11]. Let $(R, \infty) \times M_+$ be a convex end of X such that $L_0|_{(R,\infty)\times M_+}$ and $L_1|_{(R,\infty)\times M_+}$ are isomorphic to the products of (R, ∞) and Legendrian submanifolds. Assume that almost complex structures on the end are of the form $\overline{I}_t$.

Lemma 5.1 *If $\overline{u}$ is a pseudo-holomorphic strip, then the image of $\overline{u}$ is contained in $X \setminus (R, \infty) \times M_+$.*

Proof. We denote $\overline{u}$ on $(R, \infty) \times M_+$ by $\overline{u} := (\alpha, u)$. We can compute

$$u^* d\lambda_+ = \frac{1}{2}[g_{M_+}(\pi_{\xi_+} u_\tau, \pi_{\xi_+} u_\tau)^{1/2} + g_{M_+}(\pi_{\xi_+} u_t, \pi_{\xi_+} u_t)^{1/2}] d\tau dt,$$

where $u_\tau := u_*(\frac{\partial}{\partial \tau})$ and $u_t := u_*(\frac{\partial}{\partial t})$, and

$$\begin{aligned} (-\Delta\alpha) d\tau \wedge dt &= d(d\alpha \circ i) \\ &= d(-u^* \lambda_+) \\ &= -u^* d\lambda_+ \\ &= -\frac{1}{2}[g_{M_+}(\pi_{\xi_+} u_\tau, \pi_{\xi_+} u_\tau) + g_{M_+}(\pi_{\xi_+} u_t, \pi_{\xi_+} u_t)] d\tau \wedge dt, \end{aligned}$$

where $\Delta = \partial^2/\partial\tau^2 + \partial^2/\partial t^2$. Then, by the maximum principle, the maximum of α has to be achieved at a boundary point $p_0 \in \mathbf{R} \times \partial[0, 1]$. Since $\overline{u}_*(\frac{\partial}{\partial \tau})_{p_0}$ is tangent to L_0 or L_1, $\overline{u}_*(\frac{\partial}{\partial \tau})_{p_0} \in \xi_+$. We assume that almost complex structures are of the form $\overline{I}_t$, hence $\overline{u}_*(\frac{\partial}{\partial t})_{p_0} \in \xi_+$. Therefore the image of $\overline{u}$ is tangent to $\alpha(p_0) \times M_+$ at the boundary point p_0, which contradicts to the strong maximum principle. ∎

From this lemma, it is enough for us to consider only concave ends.

In the following, we assume that our almost complex structures on the symplectization of (M, λ) are of the form $\overline{I}_t$. We recall the following important matter [11] and [12]. Let $\Phi := \{\varphi : \mathbf{R} \to [0,1], \varphi' \geq 0\}$. To $\varphi \in \Phi$ we associate $\omega_\varphi := d(\varphi\lambda)$ and define

$$E_\Phi(\overline{u}) := \sup_{\varphi\in\Phi} \int_\Sigma \overline{u}^* \omega_\varphi,$$

for $\overline{u} : \Sigma \to \mathbf{R} \times M$. Note that, if $\overline{u}$ is pseudo-holomorphic, then

$$\begin{aligned}\overline{u}^*\omega_\varphi &= \overline{u}^*(d\varphi \wedge \lambda + \varphi d\lambda)\\ &= \frac{1}{2}[(\varphi'(\alpha)(\alpha_\tau^2 + \alpha_t^2 + \lambda(\alpha_\tau)^2 + \lambda(\alpha_t)^2)\\ &\quad +\varphi(\alpha)(g_M(\pi_\xi u_\tau, \pi_\xi u_\tau) + g_M(\pi_\xi u_t, \pi_\xi u_t))]d\tau \wedge dt.\end{aligned}$$

Hence $\overline{u}^*\omega_\varphi \geq 0$.

Hofer proved the following Lemma 5.2, Proposition 5.3, Theorem 5.4 and Theorem 5.5. Let Σ be $\mathbf{C}$ or $\mathbf{R} \times S^1$ and $\overline{u} = (\alpha, u) : \Sigma \to \mathbf{R} \times M$ a pseudo-holomorphic map.

Lemma 5.2 *If $E_\Phi(\overline{u}) < \infty$ and $\int_\Sigma u^*\lambda = 0$, then $\overline{u}$ is a constant map.*

Proposition 5.3 *If $E_\Phi(\overline{u}) < \infty$, then* $\sup_{z\in\Sigma} |\nabla\overline{u}| < \infty$.

Theorem 5.4 *If there is a constant c such that* $\sup_{z\in\Sigma} |\nabla\overline{u}| < c$, *then for $\beta := (\beta_1, \beta_2)$ there exist constants c_β such that $|D^\beta\overline{u}| \leq c_\beta$.*

Let $\phi : \mathbf{R} \times S^1 \to \mathbf{C} \setminus \{0\}$ be a map $\phi(\tau, t) := e^{2\pi(\tau+it)}$. We use $\overline{v} = (\alpha, v)$ to denote $\overline{u} \circ \phi : \mathbf{R} \times S^1 \to \mathbf{R} \times M$.

Theorem 5.5 *Let $\overline{u} : \mathbf{C} \to \mathbf{R}\times M$ be a non-constant pseudo-holomorphic map such that $E_\Phi(\overline{u}) < \infty$. Then there is a closed characteristic $x : \mathbf{R}/T\mathbf{Z} \to M$ and a sequence $s_k \to \infty$ such that $x_k(t) := v(s_k, t/T)$ converges to $x(t)$ in the C^∞ topology.*

Note that the above closed characteristic x is contractible. We can prove completely parallel arguments for $\Sigma = \{z \in \mathbf{C} | \mathrm{Im} z \geq 0\}$ to the above results. Let Λ be a Legendrian submanifold and $\overline{u} = (\alpha, u) : \Sigma \to \mathbf{R} \times M$ is pseudo-holomorphic map such that $\overline{u}(\{z \in \mathbf{C} | \mathrm{Im} z = 0\}) \subset \mathbf{R} \times \Lambda$.

Lemma 5.6 *If $E_{\Phi}(\overline{u}) < \infty$ and $\int_{\Sigma} u^* \lambda = 0$, then $\overline{u}$ is a constant map.*

Proposition 5.7 *If $E_{\Phi}(\overline{u}) < \infty$, then $\sup_{z \in \Sigma} |\nabla \overline{u}| < \infty$.*

Theorem 5.8 *If there is a constant c such that $\sup_{z \in \Sigma} |\nabla \overline{u}| < c$, then for $\beta := (\beta_1, \beta_2)$ there exist constants c_β such that $|D^\beta \overline{u}| \leq c_\beta$.*

Let $\phi : \mathbf{R} \times [0, 1] \to \{z \in \mathbf{R} | \mathrm{Im} z \geq 0\}$ be a map $\phi(\tau, t) := e^{\pi(\tau + it)}$. We use $\overline{v} = (\alpha, v)$ to denote $\overline{v} := \overline{u} \circ \phi : \mathbf{R} \times [0, 1] \to \mathbf{R} \times M$.

Theorem 5.9 *Let $\overline{u} : \{z \in \mathbf{C} | \mathrm{Im} z \geq 0\} \to \mathbf{R} \times M$ be a non-constant pseudo-holomorphic map such that $E_{\Phi}(\overline{u}) < \infty$. Then there is a Reeb chord $x : [0, T] \to M$ from Λ to itself and a sequence $s_k \to \infty$ such that $x_k(t) := v(s_k, t/T)$ converges to $x(t)$ in the C^∞ topology.*

Note that the above Reeb chord x is contractible. Moreover, we can similarly prove the following theorem. Let Λ_0 and Λ_1 be Legendrian submanifolds such that $\Lambda_0 \cap \Lambda_1 = \emptyset$.

Theorem 5.10 *Let $\overline{u} : \{z \in \mathbf{C} | \mathrm{Im} z \geq 0\} \setminus \{0\} \to \mathbf{R} \times M$ be a non-constant pseudo-holomorphic map such that $E_{\Phi}(\overline{u}) < \infty$ and $\overline{u}(\{z \in \mathbf{C} | \mathrm{Im} z = 0, \mathrm{Re} z > 0) \subset \mathbf{R} \times \Lambda_0$ and $\overline{u}(\{z \in \mathbf{C} | \mathrm{Im} z = 0, \mathrm{Re} z < 0) \subset \mathbf{R} \times \Lambda_1$. Then $\overline{u}$ satisfies one of the following:*

- *There are Reeb chords $x : [0, T] \to M$ from Λ_0 to Λ_1 and $x' : [0, T'] \to M$ from Λ_0 to Λ_1 and sequences $s_k \to \infty$ and $s'_k \to -\infty$ such that $x_k(t) := v(s_k, t/T)$ converges to $x(t)$ and $x'_k(t) := v(s'_k, t/T')$ converges to $x'(t)$ in the C^∞ topology. ($\lim_{k \to \infty} \alpha(s_k, [0, 1]) = \infty$ and $\lim_{k \to \infty} \alpha(s'_k, [0, 1]) = -\infty$.)*

- *There are Reeb chords $x : [0, T] \to M$ from Λ_1 to Λ_0 and $x' : [0, T'] \to M$ from Λ_1 to Λ_0 and sequences $s_k \to -\infty$ and $s'_k \to \infty$ such that $x_k(t) := v(s_k, t/T)$ converges to $x(1 - t)$ and $x'_k(t) := v(s'_k, t/T')$ converges to $x'(1 - t)$ in the C^∞ topology. ($\lim_{k \to \infty} \alpha(s_k, [0, 1]) = \infty$ and $\lim_{k \to \infty} \alpha(s'_k, [0, 1]) = -\infty$.)*

- *There are Reeb chords $x : [0,T] \to M$ from Λ_1 to Λ_0 and $x' : [0,T'] \to M$ from Λ_0 to Λ_1 and sequences $s_k \to -\infty$ and $s'_k \to \infty$ such that $x_k(t) := v(s_k, t/T)$ converges to $x(1-t)$ and $x'_k(t) := v(s'_k, t/T')$ converges to $x'(t)$ in the C^∞ topology. ($\lim_{k\to\infty} \alpha(s_k,[0,1]) = \infty$ and $\lim_{k\to\infty} \alpha(s'_k,[0,1]) = \infty$.)*

(Note that the first case is (**V**), the second is (**V**$'$) and the third is (**IV**).)

From here $(-\infty, R] \times M$ denotes a concave end of X. Let $\overline{u}_i : \mathbf{R} \times [0,1] \to X$ be a sequence of pseudo-holomorphic strips with the Lagrangian boundary conditions and $\{p_i\}$ a sequence of $\mathbf{R} \times [0,1]$ such that $|\nabla \overline{u}_i(p_i)| \to \infty$. Then there is a sequence $\varepsilon_i \to 0$ such that

$$\begin{aligned} \varepsilon_i |\nabla \overline{u}_i(p_i)| &\to \infty, \\ |\nabla \overline{u}_i(z)| &\leq 2|\nabla \overline{u}_i(p_i)| \text{ for } |z-p_i| \leq \varepsilon_i, \end{aligned}$$

see [11] and [14]. If $\bigcup_i \{\overline{u}_i(z), |z-p_i| \leq \varepsilon_i\}$ is contained in a compact set, then we can adopt the usual bubbling off phenomena in closed symplectic manifolds. Put $\overline{u}_i := (\alpha_i, u_i)$ on the concave end. Let q_i be a sequence such that $|p_i - q_i| \leq \varepsilon_i$ and $\alpha_i(q_i) \to -\infty$. Take a sequence $\delta_i \to 0$ such that $\delta_i \leq \varepsilon_i$ and $\alpha_i(z) < R$ for $|z-q_i| < \delta_i$ and $\overline{u}_i(\{|z-q_i| = \delta_i\}) \cap (\{R\} \times M) \neq \emptyset$. Then, from the mean value theorem, there is a point $q'_i \in \{|z-q_i| \leq \delta_i\}$ such that $\delta_i |\nabla \overline{u}_i(q'_i)| \to \infty$. By slightly modifying $\{q_i\}$ we may assume $\delta_i |\nabla \overline{u}_i(q_i)| \to \infty$. First we consider the case when we can choose a subsequence $\{q_{i_k}\}$ such that $\{|z-q_{i_k}| < \delta_{i_k}\} \subset \mathbf{R} \times (0,1)$. (In the following we shall use $\{q_i\}$ to denote the subsequence.) Put

$$\overline{v}_i(z) = (b_i(z), v_i(z)) := (\alpha_i(q_i + z/|\nabla \overline{u}_i(q_i)|) - \alpha_i(q_i), u_i(q_i + z/|\nabla \overline{u}_i(q_i)|)),$$

then

$$b_i(0) = 0,\ |\nabla \overline{v}_i(0)| = 1,\ |\nabla \overline{v}_i(z)| \leq 2 \text{ for } |z| \leq \delta_i |\nabla \overline{u}_i(q_i)|.$$

Then we can conclude that there is a pseudo-holomorphic map $\overline{v} = (b, v) : \mathbf{C} \to \mathbf{R} \times M$ and a subsequence of $\{\overline{v}_i\}$ which converges to $\overline{v}$ in the C^∞_{loc} topology. Secondly we consider the case of $\mathrm{Im} q_i \to 0$ and $\{|z-q_i| < \delta_i\} \cap (\mathbf{R} \times \{0\}) \neq \emptyset$, or $\mathrm{Im} q_i \to 1$ and $\{|z-q_i| < \delta_i\} \cap (\mathbf{R} \times \{1\}) \neq \emptyset$. Then we can similarly obtain a pseudo-holomorphic map $\overline{v} : \{z \in \mathbf{C} | \mathrm{Im} z \geq

$0\} \to \mathbf{R} \times M$ and a subsequence of $\{\overline{v}_i\}$ which converges to $\overline{v}$ in the C^∞_{loc} topology.

Let $\overline{u}_i : \mathbf{R} \times [0,1] \to X$ be a sequence of pseudo-holomorphic strips with the Lagrangian boundary conditions and $\{q_i\}$ a sequence of $\mathbf{R}\times[0,1]$ such that $\alpha_i(q_i) \to -\infty$, where $\overline{u}_i := (\alpha, u_i)$ on a concave end. Take a sequence δ_i such that $|\alpha_i(z)| < R$ for $|z - q_i| < \delta_i$ and $\overline{u}_i(\{|z - q_i| = \delta_i\}) \cap (\{R\} \times M) \neq \emptyset$. If δ_i are bounded, then, from the mean value theorem, there are points p_i such that $|q_i - p_i| < \delta_i$ and $|\nabla \overline{u}_i(p_i)| \to \infty$. In this case we can return to the previous one. If there is a subsequence $\delta_{i_k} \to \infty$, then we put

$$\overline{w}_k := (\alpha_{i_k}(z - \mathrm{Re} q_{i_k}) - \alpha(q_i), u_{i_k}(z - \mathrm{Re} q_{i_k})).$$

If there are points r_k such that $|\nabla \overline{w}_k(r_k)| \to \infty$, then we can also return to the previous bubbling phenomena. Hence we assume that the differential of $\overline{w}_k$ are bounded. Then there is a pseudo-holomorphic strip $\overline{v} : \mathbf{R} \times [0,1] \to \mathbf{R} \times M$ and a subsequence of $\{\overline{w}_k\}$ which converges to $\overline{v}$ in the C^∞_{loc} topology.

Proposition 5.11 *If $\overline{u}_i$ are of the type* (**I**) *or* (**II**) *or* (**II$'$**) *or* (**III**) *or* (**III$'$**), *and $\int_{\mathbf{R}\times[0,1]} \overline{u}_i^* \omega \le C$, then $E_\Phi(\overline{v}) \le e^{-R} C$.*

Proof. Notation: $K_{[a,b]} := [a,b]\times M$, $M_d := d\times M$ and $C_d := \overline{u}^{-1}((-\infty, d]\times M)$. Let $d_1 \le d_2 \le R$ and $\varphi = \varphi(\alpha) : \mathbf{R} \to [0,1]$ a function such that $\varphi' \ge 0$. Since $\partial \overline{u}^{-1}(K_{[d_1,d_2]}) = \overline{u}^{-1}(M_{d_1}) \cup \overline{u}^{-1}(M_{d_2}) \cup \overline{u}^{-1}([d_1,d_2] \times \Lambda)$, where Λ is Legendrian,

$$\begin{aligned}
&\int_{C_{d_2}} \overline{u}^* d(\varphi\lambda) - \int_{C_{d_1}} \overline{u}^* d(\varphi\lambda) \\
= \ &\int_{\overline{u}^{-1}(K_{[d_1,d_2]})} \overline{u}^* d(\varphi\lambda) \\
= \ &\int_{\partial\overline{u}^{-1}(K_{[d_1,d_2]})} \overline{u}^* (\varphi\lambda) \\
= \ &\int_{\overline{u}^{-1}(M_{d_2})} \overline{u}^* (\varphi\lambda) - \int_{\overline{u}^{-1}(M_{d_1})} \overline{u}^* (\varphi\lambda) \\
= \ &\varphi(d_2) e^{-d_2} \int_{\overline{u}^{-1}(M_{d_2})} \overline{u}^* (e^\alpha\lambda) - \varphi(d_1) e^{-d_1} \int_{\overline{u}^{-1}(M_{d_1})} \overline{u}^* (e^\alpha\lambda) \\
= \ &\varphi(d_2) e^{-d_2} \int_{C_{d_2}} \overline{u}^* \omega - \varphi(d_1) e^{-d_1} \int_{C_{d_1}} \overline{u}^* \omega.
\end{aligned}$$

If $\overline{u}$ satisfies the exponential decay conditions, then $\lim_{d_1\to-\infty}\int_{C_{d_1}}\overline{u}^*d(\varphi\lambda) = \lim_{d_1\to-\infty}T(\varphi(d_1)-\varphi(-\infty)) = 0$. Hence

$$\int_{C_{d_2}}\overline{u}^*d(\varphi\lambda) = \varphi(d_2)e^{-d_2}\int_{C_{d_2}}\overline{u}^*\omega - \lim_{d_1\to-\infty}\varphi(d_1)e^{-d_1}\int_{C_{d_1}}\overline{u}^*\omega \leq e^{-R}C.$$

For any $\varepsilon > 0$, there are $\varphi \in \Phi$ such that

$$E_\Phi(\overline{v}) - \varepsilon \leq \int_\Sigma \overline{v}^*d(\varphi\lambda).$$

For any compact set $K \subset \Sigma$, there are $\overline{u}_i$ such that

$$\left|\int_K \overline{v}^*d(\varphi\lambda) - \int_K (\alpha_i\circ\phi_i - \alpha_i(q_i), u_i\circ\phi_i)^*d(\varphi\lambda)\right| \leq \varepsilon,$$

where $\phi_i : K \to C_R$ is a suitable map. Since $\overline{u}_i^*d(\varphi\lambda) \geq 0$,

$$\int_K (\alpha_i\circ\phi_i - \alpha_i(q_i), u_i\circ\phi_i)^*d(\varphi\lambda) = \int_{\phi_i(K)}\overline{u}_i^*d(\varphi_i\lambda) \leq \int_{C_R}\overline{u}_i^*d(\varphi_i\lambda),$$

where $\varphi_i(\alpha) := \varphi(\alpha - \alpha(q_i))$. Hence

$$E_\Phi(\overline{v}) \leq e^{-R}C.$$

∎

From this proposition we can apply Theorem 5.5 to $\overline{v}$ which is the limit of the sequence $\{\overline{v}_i\}$ and also Theorem 5.10 to $\overline{v}$, the limit of the sequence $\{\overline{w}_k\}$. Moreover, we can conclude the exponential decay conditions for $\overline{v}$ [12].

Proposition 5.12 *If there is an open neighborhood $U \subset S^1 \times \mathbf{R}^{2n}$ of $S^1 \times \{0\}$ and an open neighborhood $V \subset M$ of a closed characteristic x with the minimal period τ_0 and a diffeomorphism $\varphi : U \to V$ mapping $S^1 \times \{0\}$ to x such that $\varphi^*\lambda = f\lambda_0$ with $\lambda_0 := d\theta + \sum_{i=1}^n x_n dy_n$ and a positive smooth function $f : U \to \mathbf{R}$ satisfying $f(\theta,0,0) = \tau_0$ and $df(\theta,0,0) = 0$ for all $\theta \in S^1$, then x_k as in Theorem 5.5 converges to x with the exponential decay conditions.*

Similarly we can prove

Proposition 5.13 *Under Assumption 3.3, x_k and x'_k as in Theorem 5.9 and 5.10 converge to x and x' with the exponential decay conditions.*

Under Assumption 3.2 there are no point q_i such that $|\nabla \overline{u}_i(q_i)| \to \infty$ and $\alpha_i(q_i) \to -\infty$, and under Assumption 3.5 $\overline{v}$, the limit of $\overline{w}_k$, is of the type (**IV**) or the trivial ones of the type (**V**) and (**V′**). Let $\overline{u}_i : \mathbf{R} \times [0,1] \to X$ be a sequence of pseudo-holomorphic strips of $\mathcal{M}^2_I(p_-, p_+)$ and let $\{q^s_i\}_{i=1,2,\ldots}$, $s = 1, 2, \ldots$, be sequences of $\mathbf{R} \times [0,1]$ such that $\alpha_i(q^s_i) \to -\infty$. Take a sequence δ^s_i such that $|\alpha_i(z)| < R$ for $|z - q^s_i| < \delta^s_i$ and $\{|z - q^{s_1}_i| < \delta^{s_1}_i\} \cap \{|z - q^{s_2}_i| < \delta^{s_2}_i\} = \emptyset$ for $s_1 \neq s_2$. We assume $\delta^s_i \to \infty$, and put

$$\overline{w}^s_i := (\alpha_i(z - \mathrm{Re} q^s_i) - \alpha(q^s_i), u_i(z - \mathrm{Re} q^s_i)).$$

Then there are pseudo-holomorphic strips $\overline{v}^s : \mathbf{R} \times [0,1] \to \mathbf{R} \times M$ of $\mathcal{M}^{d_s}_{IV}(\gamma^s_-, \gamma^s_+)$ or the trivial ones of (**V**) or (**V′**) and subsequences of $\{\overline{w}^s_i\}_{i=1,2,\ldots}$ which converges to $\overline{v}^s$ in the C^∞_{loc} topology. Assume that $\overline{v}^1$ and $\overline{v}^2$ are *not* the trivial ones, i.e., of the type (**IV**). Then we obtain $\overline{x} \in \hat{\mathcal{M}}^{d_x}_{II'}(p_-, \gamma^1_-)$, $\overline{y} \in \hat{\mathcal{M}}^{d_y}_{III}(\gamma^1_+, \gamma^2_-)$ and $\overline{w} \in \hat{\mathcal{M}}^{d_w}_{II}(\gamma^2_+, p_+)$ such that we can glue them with $\overline{v}^1$ and $\overline{v}^2$ to reconstruct $\overline{u}_i$. From Assumption 3.1 we can calculate $d_x + d_1 + d_y + d_2 + d_w = 2$, which contradicts to $d_x, d_y, d_w \geq 0$ and $d_1, d_2 \geq 2$. Then there is at most one $\overline{v}$ of the type (**IV**) which appears at the limit of the sequence $\{\overline{u}_i\}$. Similarly also for sequences of pseudo-holomorphic strips of $\mathcal{M}^2_{II}(\gamma_-, p_+)$ or $\mathcal{M}^2_{II'}(p_-, \gamma_+)$ or $\mathcal{M}^2_{III}(\gamma_-, \gamma_+)$.

Finally we completely finish proving Theorem 3.4.

A Newton's method

In this appendix we adopt Newton's method with proof [5] and [7].

Proposition A.1 (Newton's method)*Let $(E, \|\ \|_E)$ and $(F, \|\ \|_F)$ be Banach spaces and $f : E \to F$ a smooth map. We denote the Taylor expansion of f by*

$$f(\xi) = f(0) + Df(0)\xi + N(\xi),$$

and assume that $Df(0)$ *has a right inverse* $G : F \to E$, $Df(0)G = \mathrm{id}_F$, *such that*

$$\|GN(\xi) - GN(\zeta)\|_E \le C_N(\|\xi\|_E + \|\zeta\|_E)\|\xi - \zeta\|_E, \tag{17}$$

for some constant C_N. *Then the zero-set of* f *in* $B := \{\xi \in E | \|\xi\|_E < (4C_N)^{-1}\}$ *is a smooth manifold, whose dimension is equal to that of* $\mathrm{Ker}Df(0)$. *In fact, if we put*

$$\begin{aligned} K &= \{\xi \in \mathrm{Ker}Df(0) | \|\xi\|_E < (4C_N)^{-1}\}, \\ K^{\perp} &= \{\xi \in GF | \|\xi\|_E < (4C_N)^{-1}\}, \end{aligned}$$

then there is a smooth map $\phi : K \to K^{\perp}$ *such that* $f(\xi + \phi(\xi)) = 0$, *and all zeroes of* f *in* B *are of the form* $\xi + \phi(\xi)$. *Moreover, we have the estimate*

$$\|\phi(\xi)\|_E \le 2\|Gf(0)\|_E. \tag{18}$$

On the other hand, if we have the inequality

$$\|Gf(0)\|_E \le (8C_N)^{-1}, \tag{19}$$

then there must exist the zeros of f *in* B.

Proof. If we put $v := Df(0)u$ for $u \in E$, then $Df(0)Gv = v = Df(0)u$, and $Df(0)(Gv - u) = 0$. Moreover, if we have $Gb \in \mathrm{Ker}Df(0) \cap GF$, then $0 = Df(0)Gb = b$, and $\mathrm{Ker}Df(0) \cap GF = \{0\}$. Hence we obtain the direct decomposition $E = \mathrm{Ker}Df(0) \oplus GF$. Denote $E_1 := \mathrm{Ker}Df(0)$, $E_2 := GF$ and $\mathcal{F} := G \circ f : E_1 \oplus E_2 \to E_2$. For the natural projection $\pi : E_1 \oplus E_2 \to E_2$, we obtain $D\mathcal{F}(0) = GDf(0) = \pi$, and the Taylor expansion of $\mathcal{F}$ is

$$\mathcal{F}(\xi) = \mathcal{F}(0) + \pi(\xi) + \mathcal{N}(\xi),$$

where $\mathcal{N} := GN$. The inequalities (17) (19) become

$$\begin{aligned} \|\mathcal{N}(\xi) - \mathcal{N}(\zeta)\|_E &\le C_N(\|\xi\|_E + \|\zeta\|_E)\|\xi - \zeta\|_E, && (20) \\ \|\mathcal{F}(0)\|_E &\le (8C_N)^{-1}. && (21) \end{aligned}$$

Because $G : F \to GF$ is an isomorphism, we will prove the proposition for $\mathcal{F} : E \to E$ instead of $f : E \to F$.

For simplicity we denote the norm $\| \ \|_E$ by $\| \ \|$. From (20) we have

$$\begin{aligned}\|D\mathcal{N}(\xi)\zeta\| &\leq \|\mathcal{N}(\xi+\zeta)-\mathcal{N}(\xi)\|+o(\zeta)\|\zeta\| \\ &\leq C_N(\|\xi+\zeta\|+\|\xi\|)\|\zeta\|+o(\zeta)\|\zeta\|,\end{aligned}$$

where $o(\zeta)$ is a function such that $\lim_{\zeta\to 0} o(\zeta)=0$, and then

$$\|D\mathcal{N}(\xi)(\varepsilon\zeta/\|\varepsilon\zeta\|)\| \leq C_N(\|\xi\|+\|\xi+\varepsilon\zeta\|)+o(\varepsilon\zeta).$$

The limit of the above estimate as $\varepsilon \to 0$ is

$$\|D\mathcal{N}(\xi)(\zeta/\|\zeta\|)\| \leq 2C_N\|\xi\|,$$

and hence the operator norm of $D\mathcal{N}(\xi)$ satisfies

$$\|D\mathcal{N}(\xi)\| < 1/2$$

for $\xi \in B$. Moreover, from the differential of the Taylor expansion of $\mathcal{F}$ we obtain

$$D\mathcal{F}(\xi)=\pi+D\mathcal{N}(\xi),$$

and then

$$D\mathcal{F}(\xi)|_{E_2}=\mathrm{id}_{E_2}+D\mathcal{N}(\xi)|_{E_2}.$$

Hence, the restriction $D\mathcal{F}(\xi)|_{E_2}: E_2 \to E_2$ is an isomorphism for $\xi \in B$. Now we use:

Theorem A.2 *(Implicit function theorem)Let $\mathcal{F}: E_1 \oplus E_2 \to E_2$ be a smooth map, where E_1 and E_2 are Banach spaces, such that the differential $D\mathcal{F}(\xi_1,\xi_2)|_{E_2}: E_2 \to E_2$ is an isomorphism at zeros of $\mathcal{F}$, i.e., $\mathcal{F}(\xi_1,\xi_2)=0$. Then there is a neighborhood $W_{\xi_1} \subset E_1$ of ξ_1 and a smooth map $\phi_{\xi_1}: W_{\xi_1} \to E_2$ such that, for any $\zeta \in W_{\xi_1}$, $\mathcal{F}(\zeta,\phi_{\xi_1}(\zeta))=0$.*

Let $\xi := (\xi_1,\xi_2)$ and $\xi' := (\xi_1,\xi_2')$ be in B such that $\mathcal{F}(\xi)=\mathcal{F}(\xi')=0$. From the Taylor expansion of $\mathcal{F}$

$$\mathcal{F}(0)+\xi_2+\mathcal{N}(\xi)=\mathcal{F}(0)+\xi_2'+\mathcal{N}(\xi')=0,$$

and then

$$\begin{aligned}\|\xi_2-\xi_2'\| &= \|\mathcal{N}(\xi)-\mathcal{N}(\xi')\| \\ &\leq C_N(\|\xi\|+\|\xi'\|)\|\xi-\xi'\| \\ &\leq \frac{1}{2}\|\xi_2-\xi_2'\|.\end{aligned}$$

Hence we can write the zeros of $\mathcal{F}$ in B of the form $(\zeta, \phi(\zeta)), \zeta \in E_1$, and then $\{\xi \in B | \mathcal{F}(\xi) = 0\}$ is a smooth manifold whose tangent spaces are isomorphic to E_1.

From the equations

$$\begin{aligned} \mathcal{F}(\xi_1 + \phi(\xi_1)) &= \mathcal{F}(0) + \phi(\xi_1) + \mathcal{N}(\xi_1 + \phi(\xi_1)) = 0 \\ \mathcal{F}(\xi_1) &= \mathcal{F}(0) + 0 + \mathcal{N}(\xi_1) \end{aligned}$$

for $\xi_1 \in E_1$, we obtain

$$\phi(\xi_1) = -\mathcal{F}(\xi_1) - \mathcal{N}(\xi_1 + \phi(\xi_1)) + \mathcal{N}(\xi_1),$$

and then

$$\begin{aligned} \|\phi(\xi_1)\| &\leq \|\mathcal{F}(\xi_1)\| + \|\mathcal{N}(\xi_1 + \phi(\xi_1)) - \mathcal{N}(\xi_1)\| \\ &\leq \|\mathcal{F}(\xi_1)\| + C_N(\|\xi_1 + \phi(\xi_1)\| + \|\xi_1\|)\|\phi(\xi_1)\| \\ &\leq \|\mathcal{F}(\xi_1)\| + \frac{1}{2}\|\phi(\xi_1)\|. \end{aligned}$$

This is the inequality (18).

Finally we prove the existence of the zeros of $\mathcal{F}$ in B when the inequality (21) holds. Define a map $g : E \to E_2$ by

$$g(\xi) := -\mathcal{F}(0) - \mathcal{N}(\xi).$$

Because the inequality (20) with $\xi \in B$ and $\zeta = 0$ becomes

$$\|\mathcal{N}(\xi)\| \leq C_N \|\xi\|^2 < (16C_N)^{-1}$$

and the inequality (21) holds, the image $g(B)$ is contained in $H := \{\xi \in GF | \|\xi\| \leq 3/(16C_N)\}$. Moreover, for ξ and $\zeta \in \overline{B}$,

$$\begin{aligned} \|g(\xi) - g(\zeta)\| &\leq \|\mathcal{N}(\xi) - \mathcal{N}(\zeta)\| \\ &\leq C_N(\|\xi\| + \|\zeta\|)\|\xi - \zeta\| \\ &\leq \frac{1}{2}\|\xi - \zeta\|. \end{aligned}$$

Now we use:

Theorem A.3 *(Fixed points theorem)Let* (X, d) *be a complete metric space,* $g : X \to X$ *a map such that*

$$d(g(x), g(y)) \leq Cd(x, y), \ x, y \in X$$

for some constants $C < 1$*. Then there uniquely exists the pont* y_0 *such that* $g(y_0) = y_0$*.*

We can find the fixed point $y_0 \in H$ with respect to a map $g|_H : H \to H$. Then, from the Taylor expansion of $\mathcal{F}$ and the definition of g,

$$\mathcal{F}(y_0) = \mathcal{F}(0) + \pi(y_0) + \mathcal{N}(y_0) = 0,$$

i.e., y_0 is a zeros of $\mathcal{F}$. Note that $y_0 = \phi(0)$. ∎
